# Odoo 中文教程

## (01)odoo8.0\_Ubuntu14.04 源码安装

=====

<http://mirrors.163.com/ubuntu-releases/14.04/>

到里面找一个 ubuntu-14.04.3-server-amd64.iso 下载下来安装

=====ubun  
tu14.04 安装 odoo 开始

=====

备注，我采 www 用户运行，没有采用 odoo 用户运行，主要考虑前端我用 nginx 代理，  
采用的用户 www 达到一致

准备工作，

python 本身是 2.7.6

升级到 2.7.9

-----

准备

```
# apt-get -y install build-essential libreadline-gplv2-dev libncursesw5-dev  
libssl-dev libsqlite3-dev tk-dev libgdbm-dev libc6-dev libbz2-dev
```

安装 python2.7.9

```
# mkdir -p /opt/soft/python
```

```
# cd /opt/soft/python
```

```
# wget https://www.python.org/ftp/python/2.7.9/Python-2.7.9.tgz
```

```
# tar -xzf Python-2.7.9.tgz
```

```
# cd Python-2.7.9
```

```
# ./configure
```

```
# make
```

```
# make install
```

升级 python 完成

-----

安装 nodejs

```
# curl -sL https://deb.nodesource.com/setup | sudo bash -
```

```
# apt-get install nodejs
```

安装 pip

```
#curl
```

```
-O https://raw.githubusercontent.com/pypa/pip/master/contrib/get-pip.py
```

```
# python get-pip.py
```

安装 npm 工具

```
#pip install npm
```

-----virtualenv 是可选开始----- 喜欢虚拟环境就安装，不喜欢的就不要装

安装 virtualenv

```
# pip install virtualenv
```

是一个建立在 virtualenv 上的工具，通过它可以方便的创建/激活/管理/销毁虚拟环境

```
# pip install virtualenvwrapper
```

创建目录用来存放虚拟环境

```
# mkdir $HOME/.virtualenvs
```

在 ~/.bashrc 中添加行： export WORKON\_HOME=\$HOME/.virtualenvs

在 ~/.bashrc 中添加行： source /usr/local/bin/virtualenvwrapper.sh

生效：

```
# source ~/.bashrc
```

列出虚拟环境列表

```
# workon
```

也可以使用

```
# lsvirtualenv
```

新建虚拟环境

```
# mkvirtualenv [虚拟环境名称]
```

启动/切换虚拟环境

```
# workon [虚拟环境名称]
```

删除虚拟环境

```
# rmvirtualenv [虚拟环境名称]
```

离开虚拟环境

```
# deactivate
```

```
# mkvirtualenv --distribute --no-site-packages odoo8_venv
```

创建虚拟环境，会在 root/.virtualenvs 下面创建 odoo8\_venv，然后把相关包装在里面

接下来安装环境就在 odoo8\_venv 下面

-----virtualenv 是可选开始结束-----

安装 postgresql-----

上面若开启了 odoo8\_venv 先退出来

# deactivate

<http://www.postgresql.org/download/linux/ubuntu/>

加入源

#vi /etc/apt/sources.list.d/pgdg.list 增加下面一行然后保存

deb <http://apt.postgresql.org/pub/repos/apt/> trusty-pgdg main

:wq 保存

导入 key，下面一次性输入完回车，不要分三次

```
#wget --quiet -O - https://www.postgresql.org/media/keys/ACCC4CF8.asc | \
sudo apt-key add -
sudo apt-get update
```

可安装列表

postgresql-client-9.4 - client libraries and client binaries

postgresql-9.4 - core database server

postgresql-contrib-9.4 - additional supplied modules

libpq-dev - libraries and headers for C language frontend development

postgresql-server-dev-9.4 - libraries and headers for C language backend development

pgadmin3 - pgAdmin III graphical administration utility

安装要用的 postgresql

```
# apt-get -y install postgresql-9.4 postgresql-client-9.4
```

```
postgresql-contrib-9.4 postgresql-server-dev-9.4 libpq-dev
```

管理

```
# service postgresql start|stop|restart # 启动 停止 重启
```

启用 md5 密码访问(下面那个命令暂是不要用，到 odoo 备份没有采用 md5 来做而是采用 peer 来做)

```
# sed -i "/^host/s/ident/md5/g" /etc/postgresql/9.4/main/pg_hba.conf 连接
using MD5 hashed passwords
```

配置文件 在 /etc/postgresql 目录下 /var/lib/postgresql 主要这两个下面，  
/var/lib/postgresql 还是 postgresql 用户的家目录  
/etc/postgresql/9.4/main/postgresql.conf 主配置  
/var/lib/postgresql/9.4/main 数据库数据目录

开启远程访问

```
# vi /etc/postgresql/9.4/main/pg_hba.conf
```

在后面加一条（要换成自己的 ip）

```
host all all 192.168.0.60/32 md5
```

命令进入数据库

```
# su - postgres
```

```
-bash-4.1$ psql 进入数据库
```

设置 postgres 用户密码

```
postgres=# \password postgres
```

```
postgres=# help 得到帮助
```

退出

```
ctrl +d 或 \q 退出
```

开启远程管理

```
# vi /etc/postgresql/9.4/main/postgresql.conf
```

定位到#listen\_addresses='localhost'。PostgreSQL 安装完成后，默认是只接受来在本机 localhost 的连接请求。

将行开头都#去掉，将行内容修改为 listen\_addresses='\*'来允许数据库服务器监听来自任何主机的连接请求

```
#service postgresql restart
```

Mysql 忘记 root 密码后还是需要一点手脚的，发觉 postgresql 基本没啥特别之处

修改 pg\_hba.conf 中的 host all all 127.0.0.1/32 md5 为 host all all 127.0.0.1/32 trust 然后 sudo -u postgres psql 直接就进去了

给数据库加用户（odoo）

```
#su - postgres
```

```
-bash-4.1$ createuser --createdb --username postgres --no-createrole
```

```
--no-superuser --pwprompt odoo
```

输入密码，自己要记得哟 后面 odoo 配置文件 openerp-server.conf (db\_password 的值) 要用到 我输入的密码是 odoo

安装 postgresql-----结束

换到 root 权限

```
-bash-4.1$ exit
```

安装 odoo 需要的 python 库

安装 odoo 依赖:

准备

```
# apt-get -y install libjs-sphinxdoc libjs-underscore libfontconfig1
libjpeg-turbo8 xfonts-75dpi \
    fontconfig fonts-dejavu-core ttf-bitstream-vera fonts-freefont-ttf
gsfonts-x11 gsfonts fontconfig-config \
    libtiff5-dev libjpeg8-dev zlib1g-dev libfreetype6-dev liblcms2-dev
libwebp-dev tcl8.6-dev tk8.6-dev python-tk \
    libldap2-dev libxslt-dev libpq-dev libsasl2-dev libxml2
```

```
# useradd www
# mkdir -p /var/www/odoo
# chown -R www.www /var/www
```

用 git 把源码放在 /var/www/odoo 下面

安装 git

```
# apt-get -y install git
# su www
$ cd /var/www/odoo
```

注意后是空格 加 英文点 表示是远程源的当前目录，否则把目录都克隆下来了

```
$ git clone https://www.github.com/odoo/odoo --branch 8.0 --single-branch .
```

安装 wkhtmltopdf 来输出 pdf

```
# cd /opt/soft/python
# curl
-O http://download.gna.org/wkhtmltopdf/0.12/0.12.2.1/wkhtmltox-0.12.2.1
_linux-trusty-amd64.deb
# dpkg -i wkhtmltox-0.12.2.1_linux-trusty-amd64.deb
```

做一下软链接 odoo 用的是 /usr/bin 下面的命令

```
# ln -s /usr/local/bin/wkhtmltopdf /usr/bin/wkhtmltopdf
```

```
# wkhtmltopdf -V 查一下版本
```

wkhtmltopdf 0.12.2.1 (with patched qt)

显示安装成功

安装中文字体

```
# apt-get -y install ttf-wqy-zenhei ttf-wqy-microhei
```

安装 odoo 的依赖

```
#apt-get -y install python-cups python-dev
python-setuptools python-dateutil python-docutils python-feedparser
```

```
python-gdata \  
python-jinja2 python-ldap python-libxslt1 python-lxml python-mako  
python-mock python-openid \  
python-psycpg2 python-psutil python-pybabel python-pychart python-pydot  
python-pyparsing \  
python-reportlab python-simplejson python-tz python-unittest2  
python-vatnumber python-vobject \  
python-webdav python-werkzeug python-xlwt python-yaml python-zsi  
python-pypdf python-requests \  
python-pil python-imaging python-passlib python-decorator python-bs4  
python-bs4-doc lib cups2-dev \  

```

安装 python-ofxparse

```
# cd /opt/soft/python
```

```
#
```

```
wget https://launchpad.net/~pythoneers/+archive/ubuntu/py35asdefault/+build/7558927/+files/python-ofxparse\_0.14-1\_all.deb
```

```
# dpkg -i python-ofxparse_0.14-1_all.deb
```

进入到/var/www/odoo 安装 odoo8.0 的依赖

```
# pip install -r requirements.txt
```

安装支持扫描仪依赖库

```
# pip install evdev
```

支持自动备份，远程 ftp

```
# pip install pysftp
```

支持 base\_report 扩展

```
# pip install pycups
```

-----开始调试要安装的依赖 start-----

注：若是生产环境就不要去装了。

支持 --auto-reload 服务开启

-----

```
# pip install pyinotify
```

问题引发：

<https://github.com/seb-m/pyinotify/pull/117>

安装完，要改一下文件

参照：

<https://github.com/smarkets/pyinotify/commit/04fea85f0318050eff6a79be34f608d06be51e22>

```
# vi /usr/local/lib/python2.7/site-packages/pyinotify.py
```

在这段

```
class Notifier:
```

```
    """
```

```
        Read notifications, process events.
```

前面加

```
try:
```

```
    _poll_class = select.poll
```

```
except AttributeError:
```

```
    class _Poll(object):
```

```
        """
```

```
        poll emulator implemented using select.
```

```
        This is used to make the client code happy in case of select.poll missing.
        select.poll is missing when Gevent monkey patching is applied, Eventlet
        will soon start doing the same.
```

```
        See https://github.com/seb-m/pyinotify/issues/78.
```

```
        """
```

```
    def __init__(self):
```

```
        self._fds = []
```

```
    def register(self, fd, eventmask):
```

```
        assert eventmask == select.POLLIN, 'Only POLLIN supported right
```

```
now'
```

```
        self._fds.append(fd)
```

```
    def poll(self, timeout):
```

```
        timeout_in_seconds = timeout / 1000.0 if timeout is not None else
```

```
None
```

```
        can_read, _, _ = select.select(self._fds, [], [], timeout_in_seconds)
```

```
        return [(fd, select.POLLIN) for fd in can_read]
```

```
    def unregister(self, fd):
```

```
        try:
```

```
            self._fds.remove(fd)
```

```
        except ValueError:
```

```
            # poll.unregister is supposed to raise KeyError in case of
```

```
            # attempting to unregister a descriptor that's not registered.
```

```
            raise KeyError(fd)
```

```
_poll_class = _Poll
```

然后找到

```
self._pollobj = select.poll()
```

换为

```
self._pollobj = _poll_class()
```

删除

```
rm /usr/local/lib/python2.7/site-packages/pyinotify.pyc
```

```
# pip install pudb
```

```
# pip install ipdb
```

```
-----
```

```
-----开始调试要安装的依赖 start-----
```

碰到 Bad md5 hash for

package <https://pypi.python.org/packages/source/p/pycrypto/pycrypto-2.6.1.tar.gz>

```
-----
```

解决

```
# cd /tmp
```

```
# curl
```

```
-O https://pypi.python.org/packages/source/p/pycrypto/pycrypto-2.6.1.tar.gz
```

```
# md5sum pycrypto-2.6.1.tar.gz
```

```
# pip install pycrypto-2.6.1.tar.gz
```

最后 # pip install pysftp

```
-----
```

安装多核启动

```
# pip install cython git+git://github.com/surfly/gevent.git#egg=gevent
```

```
# pip install PyPDF2
```

安装 aeroo 报表支持

安装 less , 9.0 用到, 8 是没有用到, 可以不装, 我是没事多装了一下

```
# npm install -g less less-plugin-clean-css
```

注意

如果无法以 https 模式访问 npm 注册, 切换为 http 模式

```
npm config set registry http://registry.npmjs.org
```

或者切换到 国内的 npm 镜像站

npm config set registry <http://registry.cnpmjs.org>

建立 odoo 的工作目录（session、addons、数据库缓存文件）和 日志目录

mkdir /var/lib/odoo 这个目录主要看你用的 www 用户有没有家目录，若有，就不用这个，若没有才用，这里备用

mkdir /var/log/odoo

chown www.www /var/lib/odoo

chown www.www /var/log/odoo

-----

建立配置文件选项：

切换到 www

# su - www

\$ cd /var/www/odoo

\$ python ./odoo.py --save --stop-after-init

\$ more ~/.openerp\_serverrc 查看可用的配置选项

如下：

[options]

addons\_path = /var/www/odoo/openerp/addons,/var/www/odoo/addons

admin\_passwd = admin

auto\_reload = False

csv\_internal\_sep = ,

data\_dir = /home/www/.local/share/Odoo

db\_host = False

db\_maxconn = 64

db\_name = False

db\_password = False

db\_port = False

db\_template = template1

db\_user = www

dbfilter = .\*

debug\_mode = False

demo = {}

email\_from = False

geoip\_database = /usr/share/GeoIP/GeoLiteCity.dat

import\_partial =

limit\_memory\_hard = 2684354560

limit\_memory\_soft = 2147483648

limit\_request = 8192

limit\_time\_cpu = 60

limit\_time\_real = 120

```
list_db = True
log_db = False
log_db_level = warning
log_handler = :INFO
log_level = info
logfile = None
logrotate = False
longpolling_port = 8072
max_cron_threads = 2
osv_memory_age_limit = 1.0
osv_memory_count_limit = False
pg_path = None
pidfile = None
proxy_mode = False
reportgz = False
secure_cert_file = server.cert
secure_pkey_file = server.pkey
server_wide_modules = None
smtp_password = False
smtp_port = 25
smtp_server = localhost
smtp_ssl = False
smtp_user = False
syslog = False
test_commit = False
test_enable = False
test_file = False
test_report_directory = False
timezone = False
translate_modules = ['all']
unaccent = False
without_demo = False
workers = 0
xmlrpc = True
xmlrpc_interface =
xmlrpc_port = 8069
xmlrpcs = True
xmlrpcs_interface =
xmlrpcs_port = 8071
```

-----

在网站目录下建立配置文件 `openerp-server.conf`，把上面自动生成的配置文件选择一些项来构建自己的配置文件

`db_user = www` 这个是因为用 `www` 来开启的，从而用 `www` 来连数据库，但我们前面是用 `odoo` 用户创建的数据库用户

这个要改成 `odoo`，下面的值要按照自己当时安装时实际情况填写。

[options]

`addons_path = /var/www/odoo/openerp/addons,/var/www/odoo/addons`

`admin_passwd = admin`

`auto_reload = False` ;要开发调代码就改为 `True`，改为 `True` 会影响开机开启服务 是 `ascii` 编码问题，一时还解决不了

`db_host = 127.0.0.1`

`db_password = odoo` 这个是创建数据库我自己写的密码

`db_port = 5432`

`db_user = odoo` 创建数据库的一个用户，不能用 `www`，因为 `www` 没有用到数据中

`dbfilter = .*`

;SSL

`secure_cert_file = /etc/nginx/ssl/server.crt`

`secure_pkey_file = /etc/nginx/ssl/server.key`

;Ports to use

`xmlrpc_port = 8069`

`longpolling_port = 8072`

`limit_time_cpu = 3600`

`limit_time_real = 3600`

`workers = 2`

;LOG SETTINGS

`logfile = /var/log/odoo/odoo-server.log`

`log_level = warn`

`auto_reload = True`

运行一下

`# su www`

```
$ python openerp-server -c openerp-server.conf
```

或

```
$ python odoo.py -c openerp-server.conf
```

odoo.py 一般习惯用于命令行

浏览器访问

<http://IP:8069>

-----用 supervisor 来管理 开始-----

在开发时 有对比和服务 两种方式，稳定性还是 服务的好，特别在用 auto\_reload 时很明显

安装 supervisor

```
# pip install supervisor
```

生成配置文件

```
# mkdir -p /etc/supervisor
```

```
# echo_supervisord_conf > /etc/supervisor/supervisord.conf
```

```
# vi /etc/supervisor/supervisord.conf 对应修改为下面的内容
```

```
[unix_http_server]
```

```
file=/var/run/supervisor.sock ; (the path to the socket file)
```

```
[supervisord]
```

```
logfile=/var/log/supervisor/supervisord.log ; (main log file;default
```

```
$CWD/supervisord.log)
```

```
pidfile=/var/run/supervisord.pid ; (supervisord pidfile;default supervisord.pid)
```

```
[supervisorctl]
```

```
serverurl=unix:///var/run/supervisor.sock ; use a unix:// URL  for a unix  
socket
```

```
[include]
```

```
files = /etc/supervisor/conf.d/*.ini
```

```
[inet_http_server] ; inet (TCP) server disabled by default
```

```
;port=127.0.0.1:9001 ; (ip_address:port specifier, *:port for all iface)
```

```
port=0.0.0.0:9001 ; (ip_address:port specifier, *:port for all iface)
```

:wq 保存

此处的/etc/supervisor/conf.d/用于存放各种 program 的 supervisord 启动脚本（后缀为 ini）

```
# mkdir /etc/supervisor/conf.d/
```

```
# vi /etc/supervisor/conf.d/odoo.ini
[program:odoo]
process_name=%(program_name)s_%(process_num)02d
directory= /var/www/odoo/
command=python /var/www/odoo/openerp-server -c
/var/www/odoo/openerp-server.conf

autostart=true
autorestart=true
user=www
numprocs=1
redirect_stderr=true
stdout_logfile=/var/www/odoo/openerp-server.log
stdout_logfile_maxbytes = 500MB
```

然后添加 Supervisor 的 service 控制命令：

<https://github.com/Supervisor/initscripts> 可以查看到很多平台启动脚本

```
# cd /etc/init.d/
#
wget https://raw.githubusercontent.com/Supervisor/initscripts/master/ubuntu
# mv ubuntu supervisord
# chmod +x supervisord
```

改几个地方

```
DAEMON=/usr/local/bin/supervisord
SUPERVISORCTL=/usr/local/bin/supervisorctl
PIDFILE=/var/run/$NAME.pid
```

创建文件夹：

```
# mkdir -p /var/run/supervisor
# mkdir -p /var/log/supervisor
```

加入随机器启动服务

```
# update-rc.d supervisord defaults
```

启动 supervisord

```
# /etc/init.d/supervisord start
```

或

```
# service supervisord start
```

后器可以用浏览器 输入 <http://192.168.0.62:9001> 来管理 supervisord

-----用 supervisor 来管理 结束-----

-----用服务 来管理 结束-----

```
# cd /var/www/odoo
# chmod +x openerp-server
# su www
$ ./openerp-server -c ./openerp-server.conf
```

若运行成功进行下一步，我这里出问题了 报错

No such file or directory

想了一下原因，我是用了 windows 同步到 ubuntu 下面，导致这些文件都是 dos 格式，

解析 \r\n 不一样

解决方法，转换到 unix 格式

----

安装转换工具 tofrodos

```
$exit
```

```
# apt-get install tofrodos
```

转化 openerp-server 文件格式

```
# cd /var/www/odoo
```

```
# fromdos openerp-server
```

----

再次测试

```
# su www
```

```
$ ./openerp-server -c ./openerp-server.conf
```

一切正常

写一个启动脚本如下

```
$ exit
```

```
# cd /etc/init.d/
```

```
# vi odoo-server
```

----- 内容如下

```
#!/bin/sh
```

```
### BEGIN INIT INFO
```

```
# Provides: odoo-server
```

```
# Required-Start: $remote_fs $syslog
```

```
# Required-Stop: $remote_fs $syslog
```

```
# Should-Start: $network
```

```
# Should-Stop: $network
```

```
# Default-Start: 2 3 4 5
```

```
# Default-Stop: 0 1 6
```

```
# Short-Description: Enterprise Resource Management software
```

```
# Description: Open ERP is a complete ERP and CRM software.
```

```
### END INIT INFO
```

```

PATH=/usr/local/sbin:/usr/local/bin:/bin:/sbin:/usr/bin:
DAEMON=/var/www/odoo/openerp-server
NAME=odoo-server
DESC=odoo-server

# Specify the user name (Default: openerp).
USER=www

# Specify an alternate config file (Default: /etc/openerp-server.conf).
CONFIGFILE="/var/www/odoo/openerp-server.conf"

# pidfile
PIDFILE=/var/run/$NAME.pid

# Additional options that are passed to the Daemon.
DAEMON_OPTS="-c $CONFIGFILE"

[ -x $DAEMON ] || exit 0
[ -f $CONFIGFILE ] || exit 0

checkpid() {
    [ -f $PIDFILE ] || return 1
    pid=`cat $PIDFILE` [ -d /proc/$pid ] && return 0 return 1
}

case "${1}" in
start)
    echo -n "Starting ${DESC}: "
    start-stop-daemon --start --quiet --pidfile ${PIDFILE} \
        --chuid ${USER} --background --make-pidfile \
        --exec ${DAEMON} -- ${DAEMON_OPTS}
    echo "${NAME}."
    ;;
stop)
    echo -n "Stopping ${DESC}: "
    start-stop-daemon --stop --quiet --pidfile ${PIDFILE} \
        --oknodo echo "${NAME}."
    ;;
restart|force-reload)
    echo -n "Restarting ${DESC}: "
    start-stop-daemon --stop --quiet --pidfile ${PIDFILE} \

```

```

--oknodo
sleep 1
start-stop-daemon --start --quiet --pidfile ${PIDFILE} \
--chuid ${USER} --background --make-pidfile \
--exec ${DAEMON} -- ${DAEMON_OPTS}
echo "${NAME}."
;;
*)
N=/etc/init.d/${NAME}
echo "Usage: ${NAME} {start|stop|restart|force-reload}">&2
exit 1
;;
esac
exit 0

:wq 保存退出
-----
加到执行权限
# chmod +x odoo-server
启动
# server odoo-server start
ok 一切正常
可操作如下
server odoo-server start 启动
server odoo-server stop 停止
server odoo-server restart 重启
server odoo-server force-reload 重启

把服务放到随机器启动
# update-rc.d odoo-server defaults

-----用服务 来管理 结束-----

用 supervisord 和服务形式管理，选择一个就可以，不要两个一起用

-----文档编译 开始-----
# cd /var/www/odoo/doc

# pip -y install sphinx sphinx-patchqueue mercurial
# su www
pip install -r requirements.txt
$ cd /var/www/odoo/doc
$ make latex
-----文档编译 结束-----

```

## **(02)odoo 自定义模块**

\* 官方建议模块骨架

-----

```

addons/<my_module_name>/
| - __init__.py
| - __openerp__.py
| - controllers
|   | - __init__.py
|   | - main.py
| - data
|   | - <main_model>_data.xml
|   | - <inherited_main_model>_demo.xml
|
| - models
|   | - __init__.py
|   | - <main_model>.py
|   | - <inherited_main_model>.py
|
| - security
|   | - ir.model.access.csv
|   | - <main_model>_security.xml
|
| - static
|   | - img
|   | - lib
|   | - src
|   |   | - js
|   |   | - css
|   |   | - less
|   |   | - xml
| - views
|   | - <main_model>_templates.xml
|   | - <main_model>_views.xml

```

文件夹权限 755 文件权限 644

\_\_openerp\_\_.py 相关属性:

```

# name 模块名字
# summary 简短介绍
# description 详细描述
# author 作者
# website 模块网站
# category 模块分类
# version 模块版本号
# license 模块版本信息 默认是 AGPL-3

```

```

# depends 模块依赖
# data 模块必须加载的数据文件
# demo 示例数据
# installabel 默认为 True 可安装
# auto_install 默认是 False 如果设为 True 就根据依赖模块，依赖装了，这个模块
就安装
# application 默认是 False 如果设为 True 就成为应用模块

```

安装自定义模块

```

服务启动配置文件 addons-path 加入自己的定义容器目录 如 myaddons
addons-path=addons,myaddons
更新模块服务列表，然后找到去安装

```

模块文件夹管理

```

# data 放 demo 和 data.xml
# models 放模型定义
# controllers http 路径控制
# views 放网页视图和模板
# static 放网页的资源，里面还有 css, js ,img, lib 等
#

```

-----

```

todo_app
| - security
|   | - ir.model.access.csv
|   | - todo_access_rules.xml
| - static
| - __init__.py
| - __openerp__.py
| - todo_model.py
| - todo_view.xml

```

\* \_\_init\_\_.py 内容如下（把模型导入到应用）

```

from . import todo_model

```

\* \_\_openerp\_\_.py 内容如下（erp 本身的配置）

-----

```
{
    'name': 'To-Do Application',
    'description': 'Manage your personal Tasks with this module.',
    'author': 'Toby Chen',
    'depends': ['mail'],
    'application': True,
    'category': 'todo_app',
    'data': [
        'todo_view.xml',
        'security/ir.model.access.csv',
        'security/todo_access_rules.xml',
    ],
}
```

-----

\* todo\_model.py 内容如下（模型）

```
-----
# -*- coding: utf-8 -*-
from openerp import models, fields, api

class TodoTask(models.Model):
    _name = 'todo.task'
    name = fields.Char('Description', required=True)
    is_done = fields.Boolean('Done?')
    active = fields.Boolean('Active?', default=True)

    @api.one
    def do_toggle_done(self):
        self.is_done = not self.is_done
        return True

    @api.multi
    def do_clear_done(self):
        done_recs = self.search([('is_done', '=', 'True')])
        done_recs.write({'active': False})
        return True
```

-----

\* todo\_view.xml 内容如下（视图）

```
-----
<?xml version="1.0" encoding="utf-8" ?>
<openerp>
```

```

<data>
  <act_window id="action_todo_task"
    name="To-do Task"
    res_model="todo.task"
    view_mode="tree,form" />

  <menuitem id="menu_todo_task"
    name="To-Do Task"
    parent="mail.mail_feeds"
    sequence="20"
    action="action_todo_task" />

  <record id="view_form_todo_task" model="ir.ui.view">
    <field name="name">To-do Task Form</field>
    <field name="model">todo.task</field>
    <field name="arch" type="xml">
      <form string="To-do Task">
        <header>
          <button name="do_toggle_done" type="object"
            string="Toggle Done" class="oe_highlight"/>
          <button name="do_clear_done" type="object"
            string="Clear All Done"/>
        </header>
        <sheet>
          <group name="group_top">
            <group name="group_left">
              <field name="name"/>
            </group>
            <group name="group_right">
              <field name="is_done"/>
              <field name="active" readonly="1"/>
            </group>
          </group>
        </sheet>
      </form>
    </field>
  </record>

  <record id="view_tree_todo_task" model="ir.ui.view">
    <field name="name">To-do Task Tree</field>
    <field name="model">todo.task</field>
    <field name="arch" type="xml">
      <tree colors="gray:is_done==True">

```

```

        <field name="name"/>
        <field name="is_done"/>
    </tree>
</field>
</record>

<record id="view_filter_todo_task" model="ir.ui.view">
    <field name="name">To-do Task Filter</field>
    <field name="model">todo.task</field>
    <field name="arch" type="xml">
        <search>
            <field name="name"/>
            <filter string="Not Done"
                domain="[('is_done','=',False)]"/>
            <filter string="Done"
                domain="[('is_done','!=',False)]"/>
        </search>
    </field>
</record>
</data>
</openerp>
-----

* ir.model.access.csv 内容如下 ( )
-----
id,name,model_id:id,group_id:id,perm_read,perm_write,perm_create,perm_u
nlink
access_todo_task_group_user,todo.task.user,model_todo_task,base.group_u
ser,1,1,1,1
-----

* todo_access_rules.xml
-----
<?xml version="1.0" encoding="UTF-8" ?>
<openerp>
    <data noupdate="1">
        <record id="todo_task_user_rule" model="ir.rule">
            <field name="name">ToDo Tasks only for owner</field>
            <field name="model_id" ref="model_todo_task"/>
            <field name="domain_force">[('create_uid','=',user.id)]
            </field>
            <field name="groups" eval="[4,ref('base.group_user')]" />
        </record>
    </data>
</openerp>

```

```

    </record>
  </data>
</openerp>
-----

```

- \* 可以到系统的本地模块中找到 去安装
- \* 开服务时要以升级模块  
`./odoo.py -d v8dev -u todo_app` 用模块的目录
- \* 升级完，最好重启一下 odoo 的服务，不容易报错

```
=====
```

再来一小段

模型

```

class Fruit(models.Model):
    _name = 'mymodule.fruits'
    name = fields.Char()

```

加一个演示数据 demo.xml

```

<openerp>
  <data>
    <record id="apple" model="mymodule.fruits">
      <field name="name">apple</field>
    </record>
    <record id="banana" model="mymodule.fruits">
      <field name="name">banana</field>
    </record>
    <record id="pear" model="mymodule.fruits">
      <field name="name">pear</field>
    </record>
  </data>
</openerp>

```

看一下控制器

```

from openerp import http

class Mymodule(http.Controller):
    @http.route('/mymodule/mymodule',auth='public')
    def index(self,**kw):
        fruits = http.request.env('mymodule.fruits')
        return http.request.render("mymodule.index",{ 'fruits':fruits.search([])})

```

视图

```
<openerp>
  <data>
    <template id='index'>
      <title>MyModule</title>
      <t t-foreach="fruits" t-as="fruit">
        <p><t t-esc="fruit.id" /><t t-esc="fruit.name" /></p>
      </t>
    </template>
  </data>
</openerp>
```

上面的页面展示只有数据，不好看，可以用 `website builder` 模块美化

`__openerp__.py` 加上

`'depends':['website']`

控制器加上

`@http.route('/mymodule/mymodule', auth='public' website=True)`

视图文件修改

```
<openerp>
  <data>
    <template id="index">
      <t t-call="website.layout">
        <t t-set="title">MyModule</t>
        <div class="oe_structure">
          <div class="container">
            <t t-foreach="fruits" t-as="fruit">
              <p><t t-esc="fruit.id"/><t t-esc="fruit.name"></t></p>
            </t>
          </div>
        </div>
      </t>
    </template>
  </data>
</openerp>
```

采用了 `t-call` 调用标准模板 用 `t-set` 设置属性值 加了 `oe_structrue` 和 `container` 类

### (03)odoo 模型/记录集/公用操作

\*模型

模型是业务对象的呈现

\* 系统已定义的模型查看

设置->技术->数据结构->模型

现在定义的有 700 多个

\* 版本演变

```
from openerp.osv import fields, osv
```

->

```
from openerp import models, fields
```

-----

osv.osv ---> orm.Model ---> models.Model

osv.TransientModel ---> orm.TransientModel ---> models.TransientModel

-----

```
class MyModel(osv.osv):
```

```
    pass...
```

-----

```
class MyModel(osv.Model):
```

```
    pass...
```

-----

```
class MyModel(models.Model):
```

```
    pass...
```

-----

上面这些在后台 8.0 版本都可以运行，在后面的版本不敢确定了  
确切的查看

openerp/models.py 文件

openerp/osv/osv.py 这个文件内容纯是兼容性写法

```
except_osv = except_orm
```

```
osv = Model
```

```
osv_memory = TransientModel
```

```
osv_abstract = AbstractModel
```

左边是早期写法，很多技术文档，包含里面的官方模块也还有很多老的 api  
新的，尽量用新的 api 来写模块

openerp/osv/orm.py

把 openerp/models.py 综合进来了

系统里大部分还是老的写法，不过自己尽量用新的写法，会简洁一些

差别最大是搜索：

v7 search() 得到是 ids 要得到 recordset, 还得用 browse() 或 read()

V8 search() 得到是 recordset

```
-----
def _get_language(self, cr, uid, context):
    lang_model = self.pool.get('res.lang')
    lang_ids = lang_model.search(cr, uid, [('translatable', '=', True)],
context=context)
    lang_data = lang_model.read(cr, uid, lang_ids, ['code', 'name'],
context=context)
    return [(d['code'], d['name']) for d in lang_data]
-----
def _get_language(self):
    lang_model = self.env.get('res.lang')
    或
    # lang_model = self.env['res.lang']
    lang_data = lang_model.search_read([('translatable', '=', True)], ['code',
'name'])
    return [(d['code'], d['name']) for d in lang_data]
-----
```

@ v7 版

\* 常用模型 models.model, models.TransientModel, models.AbstractModel

model: 是基本模型，继续了它，模型就具有官方的 ORM 功能了

TransientModel: 常用于向导模型，数据是存入数据库，但不是永久的

AbstractModel: 常用于混合继承

\* 创建模型：

```
from openerp import models, fields
```

```
class Stage(models.Model):
```

```
    _name = 'todo.task.stage'
```

```
    _order = 'sequence,name'
```

```
    _rec_name = 'name'
```

```
    _table = 'todo_task_stage'
```

```
field1 = fields.Char()
```

```
_columns = {
```

```
    'name': fields.char('State', size=64, required=True, translate=True),
```

```
    'sequence': fields.integer('Sequence', help="Used to order states."),
```

```
    'state_color': fields.selection(STATE_COLOR_SELECTION, 'State Color'),
```

```

        'team': fields.selection(STATE_SCOPE_TEAM, 'Scope Team'),
    }

    _defaults = {
        'sequence': 1,
    }

```

哪些关键词可以定义,可查看 `/openerp/models.py` 中的 `class BaseModel(object):` 下面的定义

```

# _name 模型的标识符,用于引用,全局唯一,一般格式
"ModuleName.ClassName"
# _rec_name 覆盖默认的名称字段,重新定义,一般会加其它合成方法生成名称,
# _table 映射到数据库的表名,可自定义,默认是模型标识符把"."换成"_" 连起来
# _columns 设置字段名 字典{字段名->字段声明}
# _defaults 设置字段的默认值
# _auto 是否创建对象对应的 table 缺省为 True
# _inherit 继承对象当不再定义 _name 时,就是用父对象,若再定义_name 就生
成了新的对象
# _inherits 继承对象,且创建新的对象,不拥有父对象的字段,但可以操作父对象的
字段
# _constraints 对象约束
def _check_date(self,cr,uid,ids)
    for rec in self.browse(cr,uid,ids):
        search_ids =self.search(cr,uid,['date_from','<=',
rec.date_to),('date_to','>=',rec.date_from),
        ('employee_id','=', rec.employee_id.id),('id','<>',rec.id)])
        if search_ids:
            return False
        return True
    _constraints=[_check_date,u'你在相同的时间段不允许创建多张请假条!
',[u'起始日期',u'结束日期']]

# _sql_constraints 数据库约束,最底层级别的约束
_sql_constraints =[
    ('date_check',"CHECK(date_from <= date_to)",u"开始日期必须小于
结束日期"),
    ('days_check',"CHECK(days>0)",u"请假天数必须大于 0")
]

# _log_access 是否自动在对应的数据表中增加
create_uid,create_date,write_uid,write_date 四个字段

```

可用于对象的方法(`perm_read`)读取, 权限控制  
缺省是 `True`

```
# _order 定义 search()和 read()方法是排序, 缺省是 id 升序
# _parent_store
# _parent_name
# _parent_order
```

得到模型

```
self.env['todo.task.stage'] 或 self.env.get('todo.task.stage')
旧 api 是 self.pool['todo.task.stage']或 self.pool.get('todo.task.stage')
```

`Transient` 和 `Abstract`

查看系统已注册的模型  
技术->数据结构->模型

\* 三种常用继承 (在 `model` 中操作)

`_inherit` 没重定义 `_name` 这样数据库不会新建对象表, 用被继承的表  
`_inherit` 重定义 `_name` 这样数据库会创建新的对象表存储  
`_inherits` 是复合继承, 有模型对象, 有字段对象

示例:

```
class MyModelExtended(Model):
    _inherit = 'a.model'          # direct heritage
    _inherit = ['a.model', 'a.other.model']  # direct heritage
    _inherits = {'a.model': 'field_name'}    # polymorphic heritage
```

\* 基本字段类型:

具有哪些字段类型可以查看 `openerp/fields.py` 中定义的字段类

例子:

```
name = fields.Char('Name',40,translate=True)
desc = fields.Text('Description')
state = fields.Selection( [('draft','New'),
('open','Started'),('done','Closed')], 'State')
docs = fields.Html('Documentation')
sequence = fields.Integer('Sequence')
perc_complete = fields.Float('% Complete',(3,2))
date_effective = fields.Date('Effective Date')
```

```

date_changed = fields.Datetime('Last Changed')
fold = fields.Boolean('Folded')
image = fields.Binary('Image')

```

用方法设置默认值:

```

a_field = fields.Char(default=compute_default_value)
def compute_default_value(self):
    return self.get_value()

```

注: 参数 **self**, 现在 **python2.7.x** 只是类中的方法, 第一个参数就是 **self**

但在调用这个方法的时候不必为这个参数赋值

例子说明: 创建了一个类 **MyClass**, 实例化 **MyClass** 得到了 **MyObject** 这个对象, 然后调用这个方法 **MyObject.method(arg1,arg2)**, 这个过程中, Python 会自动转为 **Myclass.mehod(MyObject,arg1,arg2)**

```

# Char 字符串
size:字符串长度
translate 字符串可翻译

```

```

# Text 文本 , 没有长度限制
translate 字符串可翻译

```

```

# Selection 下接选择列表
下接选择列表
例子:

```

```

aselection = fields.Selection([('a', 'A')])
aselection = fields.Selection(selection=[('a', 'A')])
aselection = fields.Selection(selection='a_function_name')

```

```

class SomeModel(models.Model):
    _inherits = 'some.model'
    type = fields.Selection(selection_add=[('b', 'B'), ('c', 'C')]) #增加

```

选项

```

# Html html 文本
translate 字符串可翻译

```

```

# Integer 整数

```

```

# Float 浮点数

```

```

digits 设定 整数部分的长度, 和小数部分的精度位 afloat =
fields.Float(digits=(32, 32))

```

```

# Date 日期

```

context\_today 得到今天的日期

today 得到系统的日期

from\_string 从字符串转成日期对象

to\_string 从日期对象转字符串

例子:

```
>>> from openerp import fields

>>> adate = fields.Date()
>>> fields.Date.today()
'2014-06-15'
>>> fields.Date.context_today(self)
'2014-06-15'
>>> fields.Date.context_today(self,
timestamp=datetime.datetime.now())
'2014-06-15'
>>> fields.Date.from_string(fields.Date.today())
datetime.datetime(2014, 6, 15, 19, 32, 17)
>>> fields.Date.to_string(datetime.datetime.today())
'2014-06-15'

日期格式化 DATE_FORMAT='%Y-%m-%d'
字段赋当前日期 fields.date.context_today,
fields.date.context_today(self,cr,uid,context=context),
fields.date.today()

官方建议写法 fields.date.context_today
字符串转日期 datetime.datetime.strptime(sale.date,DATE_FORMAT)
日期转字符串
datetime.datetime.strftime(datetime.date.today(),DATE_FORMAT)
python 获取当前日期 datetime.date.today()
```

# Datetime 时间

context\_timestamp 得到今天的时间

now 得到系统的时间

from\_string 从字符串转成日期对象

to\_string 从日期对象转字符串

例子:

```
>>> fields.Datetime.context_timestamp(self,
timestamp=datetime.datetime.now())
datetime.datetime(2014, 6, 15, 21, 26, 1, 248354, tzinfo=<DstTzInfo
'Europe/Brussels' CEST+2:00:00 DST>)
>>> fields.Datetime.now()
'2014-06-15 19:26:13'
>>> fields.Datetime.from_string(fields.Datetime.now())
```

```

datetime.datetime(2014, 6, 15, 19, 32, 17)
>>> fields.Datetime.to_string(datetime.datetime.now())
'2014-06-15 19:26:13'
return { 'value': { 'shop_accept_datetime': time.strftime("%Y-%m-%d
%H:%M:%S",time.localtime(time.time())) }}

```

时间格式化 DATETIME\_FORMAT="%Y-%m-%d %H:%M:%S"

包含毫秒 DATETIME\_FORMAT="%Y-%m-%d %H:%M:%S.%f"

字段赋当前时间 fields.datetime.now(),

fields.datetime.context\_timestamp(self,cr,uid,datetime.now(),context=context)

官方建议写法 fields.datetime.now()

python 获取当前时间 datetime.datetime.now()

# Boolean 布尔值(true, false) 若 default=True 复选框默认选上

# Bninary 二进制

储存文件采用 base64 编码

# function: 函数型, 该类型的字段, 字段值由函数计算而得, 不存储在数据表中  
其定义格式为:

```

fields.function(fnct, arg=None, fnct_inv=None, fnct_inv_arg=None,
type='float',

```

```

    fnct_search=None, obj=None, method=False, store=True)

```

@ type 是函数返回值的类型。

@ method 为 True 表示本字段的函数是对象的一个方法, 为 False 表示是全局函数, 不是对象的方法。

如果 method=True, obj 指定 method 的对象。

@ fcnt 是函数或方法, 用于计算字段值。如果 method = true, 表示 fcnt 是对象的方法, 其格式如下:

def fnct(self, cr, uid, ids, field\_name, args, context), 否则, 其格式如下:

def fnct(cr, table, ids, field\_name, args, context)。ids 是系统传进来的当前  
存取的 record id。field\_name 是本字段名, 当一个函数用于多个函数字段类型

时,

本参数可区分字段。args 是'arg=None'传进来的参数。

@ fcnt\_inv 是用于写本字段的函数或方法。如果 method = true, 其格式是:

```

def fcnt_inv(self, cr, uid, ids, field_name, field_value, args, context),

```

否则格式为:

```

def fcnt_inv(cr, table, ids, field_name, field_value, args, context)

```

@ fcnt\_search 定义该字段的搜索行为。如果 method = true, 其格式为:

```

def fcnt_search(self, cr, uid, obj, field_name, args), 否则格式为: def

```

fcnt\_search(cr, uid, obj, field\_name, args)

@ store 表示是否希望在数据库中存储本字段值，缺省值为 False。

不过 store 还有一个增强形式，格式为

```
store={'object_name':(function_name,[
    'field_name1','field_name2'],priority))} , 其含义是，如果对象
'object_name'的字段
    ['field_name1','field_name2']发生任何改变，系统将调用函数
function_name,
    函数的返回结果将作为参数(arg)传送给本字段的主函数，即 fnct。
```

# many2one: 多对一关系，格式为: fields.many2one(关联对象 Name, 字段显示名, ... )。可选参数有:

ondelete, 可选值为"cascade"和"null", 缺省值为"null", 表示 one 端的 record 被删除后, many 端的 record 是否级联删除。

# one2many: 一对多关系，格式为: fields.one2many(关联对象 Name, 关联字段, 字段显示名, ... ),例:

```
'address': fields.one2many('res.partner.address', 'partner_id',
'Contacts')。
```

# many2many: 多对多关系。例如:

```
'category_id':fields.many2many('res.partner.category','res_partner_category
_rel',
```

```
'partner_id','category_id','Categories'), 表示以多对多关系关联到对象
res.partner.category,
```

关联表为'res\_partner\_category\_rel', 关联字段为 'partner\_id'和 'category\_id'。当定义上述字段时,

OpenERP 会自动创建关联表为 'res\_partner\_category\_rel', 它含有关联字段 'partner\_id'和'category\_id'

# reference: 引用型，格式为: fields.reference(字段名, selection, size, ... )。其中 selection 是:

1)返回 tuple 列表的函数，或者 2)表征该字段引用哪个对象(or model)的 tuples 列表。

reference 字段在数据库表中的存储形式是 (对象名, ID), 如(product.product, 3)表示引用对象 product.product (数据表 product\_product) 中 id=3 的数据。

reference 的例子:

```
def _links_get(self, cr, uid):
    cr.execute('select object,name from res_request_link order by
priority')
    return cr.fetchall()
...
'ref':fields.reference('Document Ref 2', selection=_links_get,
size=128),
```

...

上例表示，字段 **ref** 可以引用哪些对象类型的 **resource**，可引用的对象类型从下拉框选择。

下拉框的选项由函数 `_links_get` 返回，是 `(object,name)` 对的列表，如  
`[("product.product","Product"),`  
`("account.invoice","Invoice"), ("stock.production.lot","Production`  
`Lot")]`。

**# related:** 关联字段，表示本字段引用关联表中的某字段。格式为：`fields.related(关系字段,引用字段,`

`type, relation, string, ...)`，关系字段是本对象的某字段（通常是 `one2many` or `many2many`），

引用字段是通过关系字段关联的数据表的字段，`type` 是引用字段的类型，

如果 `type` 是 `many2one` or `many2many`, `relation` 指明关联表。例子如下：

```
'address': fields.one2many('res.partner.address', 'partner_id',  
'Contacts'),  
'city': fields.related('address','city',type='char', string='City'),  
'country': fields.related('address','country_id',type='many2one',  
relation='res.country', string='Country'),
```

这里，`city` 引用 `address` 的 `city` 字段，`country` 引用 `address` 的 `country` 对象。  
在 `address` 的关联对象 `res.partner.address` 中，

`country_id` 是 `many2one` 类型的字段，所以 `type='many2one'`,  
`relation='res.country'`。

**# property:** 属性字段，下面以具体例子解说 `property` 字段类型。

```
'property_product_pricelist': fields.property('product.pricelist',  
type='many2one',  
relation='product.pricelist',string="Sale Pricelist", method=True,  
view_load=True, group_name="Pricelists Properties")
```

这个例子表示，本对象通过字段 `'property_product_pricelist'` 多对一  
(`type='many2one'`)

关联到对象 `product.pricelist(relation='product.pricelist')`。和 `many2one` 字段类型不同的是，

`many2one` 字段会在本对象中创建数据表字段 `'property_product_pricelist'`，  
`property` 字段类型不会

创建数据表字段 `'property_product_pricelist'`。`property` 字段类型会从数据表  
`ir.property` 中查找

`name='property_product_pricelist'`(即字段定义中的 `'product.pricelist'` 加上前缀 `property`，

并将 `"."` 替换成 `"_"` 作为 `name`)且 `company_id` 和本对象相同的记录，从该记录的  
`value` 字段(`value` 字段

类型为 `reference`)查得关联记录，如 `(product.pricelist,1)`，表示本对象的

resource 多对一关联

到对象 product.pricelist 的 id=1 的记录。也就是说，property 字段类型通过 ir.property 间接多对一关联到别的对象。

property 字段类型基本上和 many2one 字段类型相同，但是有两种情况优于 many2one 字段。其一是，例如，

当有多条记录通过 ir.property 的 name='property\_product\_pricelist'的记录关联到记录 (product.pricelist,1)，

此时，如果希望将所有关联关系都改成关联到记录(product.pricelist,2)。如果是 many2one 类型，不写代码，

很难完成此任务，是 property 字段的话，只要将 ir.property 中的 value 值 (product.pricelist,1)

改成(product.pricelist,2)，则所有关联关系都变了。修改 ir.property 的 value 值可以在系统管理下的

菜单 Configuration --> Properties 中修改。其二是，例如，同一业务伙伴，但希望 A 公司的用户进来看到

的该业务伙伴价格表为 pricelistA，B 公司的用户进来看到的该业务伙伴价格表为 pricelistB，

则 many2one 类型达不到该效果。property 类型通过 ir.property 中的记录关联时加上了 company\_id 的条件，

因此可以使得不同公司的员工进来看到不同的关联记录。

由于 property 类型通过 ir.property 关联，因此，每个 property 类型的字段都必须在 ir.property 中有一条关联记录。

这可以在安装时导入该条记录，参考代码如下：

```
<record model="ir.property" id="property_product_pricelist">
  <field name="name">property_product_pricelist</field>
  <field name="fields_id" search="[(('model','=', 'res.partner'),
('name','=', 'property_product_pricelist'))]"/>
  <field name="value" eval="'product.pricelist,'+str(list0)"/>
</record>
```

\* 字段集中写法

```
_columns = {
  'name':fields.char( u'课程名',size=64,select=True),
  'date_start':fields.date(u'开始日期',select=True),
  'total_day':fields.float(u'总天数',digits=(16,1)),
  'teacher':fields.many2one('res.users',u'授课老师'),
  'students':fields.many2many('res.partner',string=u'学生'),
  'price':fields.float(u'价格',digits=(16,2)),
}
```

采用\_columns 关键词来描述

\* 普通字段属性

```
# string 字段显示名 label, 任意字符串
# help='str' 用于悬挂帮助信息提示
# readonly=True 本字段是否只读, 缺省值: False
# required=True 本字段是否必须的, 缺省值: False。
# index = True 设置字段创建索引
# select=True 相关联字段下拉列表
# default 设置字段的默认值
name = fields.Char(default="Unknown")
user_id = fields.Many2one('res.users', default=lambda self:self.env.user)
# states 定义特定 state 才生效的属性, 格式为: {'name_of_the_state':
list_of_attributes},
    其中 list_of_attributes 是形如[('name_of_attribute', value), ...]的 tuples 列表。
    例子(参见 account.transfer): 'partner_id': fields.many2one('res.partner',
'Partner',
    states={'posted':[('readonly',True)]}),
# groups 设置权限组访问可见, 值为列表形式, 元素是组的 xml ids(也就是外部标识符)
# copy=False 设置字段不能被复制, 普通字段是 True, 在 one2many 是默认是 False
# oldname='field' 当一个字段在新版本重命名了, 指定老的字段, 老的字段的数据会自动拷贝到新的字段中
# compute 给定一个方法名计算出该字段
# inverse 给定一个方法名反转该字段
# search 给定一个方法名搜索该字段
# store 设定该字段是否存在数据表中, 在用了 compute 时为 False ,其它默认是 True
# compute_sudo 设定是否要超级用户来计算该字段, 默认是 False
upper = fields.Char(compute='_compute_upper',
                    inverse='_inverse_upper',
                    search='_search_upper')

@api.depends('name')
def _compute_upper(self):
    for rec in self:
        rec.upper = rec.name.upper() if rec.name else False

def _inverse_upper(self):
    for rec in self:
        rec.name = rec.upper.lower() if rec.upper else False

def _search_upper(self, operator, value):
    if operator == 'like':
```

```

        operator = 'ilike'
        return [('name', operator, value)]
# related 序列的字段名，用于关联字段，默认不存数据表中，可以 store=True 来存，
# company_dependent 定义该字段是不是公司依赖
# change_default 别的字段的缺省值是否可依赖于本字段，缺省值为：False。
例子(参见 res.partner.address) 'zip': fields.char('Zip', change_default=True,
size=24),
    这个例子中，可以根据 zip 的值设定其它字段的缺省值，例如，可以通过程序代码，
    如果 zip 为 200000 则 city 设为“上海”，如果 zip 为 100000 则 city 为“北京”。
# domain: 域条件，缺省值：[]。在 many2many 和 many2one 类型中，字段值是
关联表的 id，
    域条件用于过滤关联表的 record。例子： 'default_credit_account_id':
fields.many2one('account.account',
    'Default Credit Account', domain="[('type','!=','view')]",
    本例表示，本字段关联到对象('account.account')中的，type 不是'view'的 record。
# context 上下文
# invisible: 本字段是否可见，即是否在界面上显示本字段，缺省值 True。
# selection: 只用于 reference 字段类型，参见前文 reference 的说明。
# size 只用于 Char 设置可最大接收字符数
# translate=true 用于 Text Char Html 本字段值（不是字段的显示名）是否可翻译，
缺省值：False。
# ondelete 用于关联字段，定义删除方式
# manual
# deprecated=True 当用这个字段，日志会记录警告，主要是版本升级一些过渡字段
# password ="True" 密码星号显示
# nolabel ="1" 隐藏标签
# attr 属性 可以定义多条件这段只读显示
# digits 格式化浮点数
    <field digits="(14,3)" name="volume"
attrs="{readonly:[('type','=','service')]}"
# default_focus 新窗口光标位置
# Widget 多种部件显示格式 widget="one2many_list"
    one2one_list, one2many_list, many2one_list,
many2many,Url,Email,Image,float_time,reference

```

不同的字段类型具有不同的属性，上面是公用的居多，其它的可以在  
 openerp/fields.py 和 openerp/osv/fields.py 中找，主要看 \_\_slots\_\_ 的列表值

\*保留字段名字

```

# id 数据库自动生成做为主键
# create_uid 创建记录时的用户

```

```

# create_date 创建记录时的日期和时间
# write_uid 修改记录时的最后用户
# write_date 修改记录时最后日期和时间

*内置专用字段名
# name (Char) 记录的默认名, 但可以用 _rec_name 去覆盖
# active (Boolean) 标识记录的有效性 常用于 domain domain 是元组表达式
# sequence (Integer) 用在列表视图记录排序
# state (Selection) 显示记录的生命周期
# parent_id, parent_left, parent_right 用于记录的上下级

* 部件字段类型(Widgets)
# image(binary)
# monetary(float)
# duration (float)
# relative(datetime)
# contact(res.partner many2one)

* 字段条件约束
__constraints=[(check_phone,u'手机号码和电话号码不能同时为空
,['mobile_number','phone_number']),
(check_estimated_ship_date,u'期望发货日期必须比当前日期要大
,['estimated_ship_date'])]
def check_phone(self, cr, uid, ids, context=None):
    for apply_delivery in self.browse(cr,uid,ids,context=context):
        if apply_delivery.mobile_number or apply_delivery.phone_number:
            return True
    return False
def check_estimated_ship_date(self, cr, uid, ids, context=None):
    apply_delivery =self.browse(cr,uid,ids,context=context)
    estimated_ship=time.strptime(apply_delivery[0].estimated_ship_date,'
%Y-%m-%d %H:%M:%S')
    if time.mktime(estimated_ship)
        return False
    return True

__sql_constraints = {
    ('internal_code_uniq', 'unique(internal_code)',
    'Internal Code must be unique!')
}
internal_code 必须是唯一

```

## \* 模型的关系

例子:

```
class TodoTask(models.Model):
    _inherit = 'todo.task'
    stage_id = fields.Many2one('todo.task.stage','Stage')
    tage_ids =fields.Many2many('todo.task.tag',string='Tages')
```

model 和 string 所有关系都接受属性,

### # 多对一 Many2one

意思就是到对方的对象上选择一个用来关联本记录

```
parent_id = fields.Many2one(string='Parent Tag',
comodel_name='product.tag',
select=True, ondelete='cascade')
```

string : 显示标签名称

comodel\_name: 引用的目标模型名

select=True 下接选择列表在视图显示时

domain

context 是上下文

ondelete 默认值为 set null 表示关联记录删除 本字段设为空

restrict 关联对方记录删除, 本关联字段不与其删除, 要删除本关联字段的记录, 才能删除关联对方的记录

cascade 关联对方记录删除, 对于本关联字段对应的记录全部跟着删除

除

auto\_join=False 允许用 sql 语句来关联

delegate=False

### # 一对多 One2Many

接受的属性 和 Many2one 一样

可以很简单地从 one 得到 many 方的对应的所有记录

```
class Stage(models.Model):
    _name = 'todo.task.stage'
    Stage class relation with Tasks:
    tasks = fields.One2many(
        'todo.task', # 关联对象
        'stage_id', # 本对象提供给关联对象关联的字段, 这里是主键
                    # 这个字段只要是唯一就可以
        'Tasks in this stage')
```

```
parent_id = fields.Many2one(string='Parent Tag',
```

```

comodel_name='product.tag',
    select=True, ondelete='cascade')
    child_ids = fields.One2many(string='Child Tags',
comodel_name='product.tag',
    inverse_name='parent_id')

```

这里 parent\_id 会存入数据表，child\_ids 就不会了

string : 显示标签名称

comodel\_name: 引用的目标模型名

inverse\_name 反向关联的字段 对应 Many2one

domain:

context:

auto\_join=False 允许用 sql 语句来关联

limit='1000' 定义读时出多少个记录

copy=False

# 正反关联定义:

Many2one 和 one2many 是成对出现的

Many2one 找关联对象

One2many 提供给关联对象的关联字段

@ 正:

```

class TodoTask(models.Model):
    _inherit = 'todo.task'
    stage_id = fields.Many2one('todo.task.stage','Stage')

```

@ 反:

```

class Stage(models.Model):
    _name = 'todo.task.stage'
    tasks = fields.One2many(
        'todo.task',
        'stage_id',
        'Tasks in this stage')

```

# 多对多 Many2many

会转换为 Many2one Many2one

这个 one，自然就是境加的中间关联表，一般表名后缀为 \_rel

@ class 为 TodoTask

```

tag_ids = fields.Many2many(
    'todo.task.tag', # related model
    'todo_task_tag_rel', # relation table name
    'task_id', # field for "this" record

```

```
'tag_id', # field for "other" record
string='Tasks')
```

也可以用长表单键表示

```
tag_ids = fields.Many2many(
    comodel_name='todo.task.tag', # related model
    relation='todo_task_tag_rel', # relation table name
    column1='task_id', # field for "this" record
    column2='tag_id', # field for "other" record
    string='Tasks')
```

string: 显示标签名称

comodel\_name: 引用的目标模型名

relation: 存多对多关系的关系表名

column1: 存目标模型关系字段在关系表中

column2: 存本模型关系字段在关系表中

domain

context 是上下文

limit='1000' 定义读时出多少个记录

对对方关联对象也要加一条反向关联，这个相对简单

@ class 为 Tag

```
task_ids = fields.Many2many(
    'todo.task', # related model
    string='Tasks' )
```

# 父子分层

可以用 Many2one 表示子到父， 用 One2many 表示父到子

```
class Tags(models.Model):
    _name = 'todo.task.tag'
    _parent_store = True
    # _parent_name = 'parent_id'
    name = fields.Char('Name')
    parent_id = fields.Many2one(
        'todo.task.tag', 'Parent Tag', ondelete='restrict')
    parent_left = fields.Integer('Parent Left', index=True)
    parent_right = fields.Integer('Parent Right', index=True)
```

为了方便还会加一个字段

```
child_ids = fields.One2many('todo.task.tag', 'parent_id', 'Child
Tags')
```

# One2Many 和 Many2many 的 eval 赋值

```
<field name="tag_ids"
    eval="[(6,0,
    [ref('vehicle_tag_leasing'),
    ref('fleet.vehicle_tag_compact'),
    ref('fleet.vehicle_tag_senior')])]" />
```

(0,\_,{'field': value}) 这将创建一个新的记录并连接它  
(1,id,{'field': value}): 这是更新一个已经连接了的记录的值  
(2,id,\_) 这是删除或取消连接某个已经连接了的记录  
(3,id,\_) 这是取消连接但不删除一个已经连接了的记录  
(4,id,\_) 连接一个已经存在的记录  
(5,\_,\_) 取消连接但不删除所有已经连接了的记录  
(6,\_,[ids]) 用给出的列表替换掉已经连接了的记录  
这里的下划线一般是 0 或 False

# 引用字段动态关系

Refers to

```
class TodoTask(models.Model):
    refers_to = fields.Reference(
        [('res.user', 'User'), ('res.partner', 'Partner')],
        'Refers to')
```

可用保用任何注册模型

```
from openerp.addons.base.res import res_request
def referencable_models(self):
    return res_request.referencable_models(
        self, self.env.cr, self.env.uid, context=self.env.context)
```

```
class TodoTask(models.Model):
    refers_to = fields.Reference(
        referencable_models, 'Refers to')
```

这样就不会只局限在用户和合作伙伴两个模型了

\* 字段设置

不是所有定义都会存到数据表中

首先 `_auto` 要为 `true` 缺省也是 `true`

# 普通定义

```
name = fields.Char('Tag Name', required=True, translate=True)
```

```

#显示名称取代通过计算
_rec_name='display_name'
display_name = field.Char('Full Name'
compute="_compute_display_name")
#这个是不会存数据表中的

@api.one
@api.depends('name', 'parent_id.name')
def _compute_display_name(self):
    """ Return the tags' display name, including their direct parent. """
    if self.parent_id:
        self.display_name = self.parent_id.display_name + ' / ' + self.name
    else:
        self.display_name = self.name
#

* 字段操作
# 计算
class TodoTask(models.Model):
    stage_fold = fields.Boolean(
        'Stage Folded?',
        compute='_compute_stage_fold')

    @api.one
    @api.depends('stage_id.fold')
    def _compute_stage_fold(self):
        self.stage_fold = self.stage_id.fold

-----

from openerp import api
total = fields.Float(compute='_compute_total')

@api.depends('value', 'tax')
def _compute_total(self):
    for record in self:
        record.total = record.value + record.value * record.tax

# 关联字段
participant_nick = fields.Char(string='Nick name',
                                related='partner_id.name')
合作伙伴名字改，该对象的昵称跟着变化

```

```

# 搜索和写入
class TodoTask(models.Model):
    stage_fold = fields.Boolean(
        'Stage Folded?',
        compute='_compute_stage_fold',
        # store=False) # the default
        search='_search_stage_fold',
        inverse='_write_stage_fold')

    @api.one
    @api.depends('stage_id.fold')
    def _compute_stage_fold(self):
        self.stage_fold = self.stage_id.fold

    def _search_stage_fold(self, operator, value):
        return [('stage_id.fold', operator, value)]

    def _write_stage_fold(self):
        self.stage_id.fold = self.stage_fold
# 为了搜索加字段
    stage_state = fields.Selection(
        related='stage_id.state',
        string='Stage State')

# 模型约束（SQL 和 Python）
# 一个用户在一时间只有一个活动的任务，加复合主键一样
class TodoTask(models.Model):
    _sql_constraints = [
        ('todo_task_name_uniq',
         UNIQUE (name, user_id, active)',
         'Task title must be unique!')]

# 检查名称少于 5 个字符
class TodoTask(models.Model):
    @api.one
    @api.constrains('name')
    def _check_name_size(self):
        if len(self.name) < 5:
            raise ValidationError('Must have 5 chars!')

```

\* 向导对象

向导是一个动态与用户进行互动对话的模型

TransientModel 扩展 openerp/models.py 中的 Model 类

#向导的数据不是固定的，系统会定期清除数据

#向导没有任何权限限制，用户可以随意创建

兼容 osv\_memory = TransientModel

如: class procurement\_compute(models.TransientModel)

class procurement\_compute(osv.osv\_memory) 旧

class procurement\_compute(osv.TransientModel) 旧

# 向导是通过 "ir.actions.act\_window" 触发的

```
<record model="ir.actions.act_window" id="act_make_procurement">
  <field name="name">Procurement Request</field>
  <field name="res_model">make.procurement</field>
  <field name="src_model">product.product</field>
  <field name="view_mode">form</field>
  <field name="target">new</field>
  <field name="key2">client_action_multi</field>
</record>
```

可以简写:

```
<act_window name="Procurement Request"
  res_model="make.procurement"
  src_model="product.product"
  view_mode="form"
  target="new"
  key2="client_action_multi"
  id="act_make_procurement"/>
```

id 不可重名

name 菜单名称

src\_model 上级对象

res\_model 向导对象

view\_mode 视图类型

target 开打方式 current 当前窗口, new 新建窗口, inline 行内编辑,

inlineview 内嵌视图

key2 菜单出现位置

定义向导视图

一般两个确认事件，选择取消后窗口自动消失

```
<button name="make_procurement" string="Ask New Products"
type="object" class="oe_highlight" />
```

or

```
<button string="Cancel" class="oe_link" special="cancel" />
```

\* 记录集

一个模型的实例同时也是一个记录集的实例

一个记录集是同一个模型的一组记录

```
class AModel(Model):
```

```
    # ...
```

```
    def a_fun(self):
```

```
        self.do_something() # self 在这里就是一个记录集，会包含很多记录
```

```
        record_set = self
```

```
        record_set.do_something()
```

```
    def do_something(self):
```

```
        for record in self:
```

```
            print record
```

如果用了@api.one 来修饰，self 就会当前一条记录，不是记录集了

\*记录集支持的操作

rs1 | rs2 求并集 是指两个集合的所有元素构成的集合

rs1 + rs2 求两个集直接连起来，不管重复

rs1 & rs2 求交集 是指两个集合元素相同的部分构成的集合

rs1 - rs2 求差集 是指其中一个集合中除去另一个集合相同元素以后剩余的元素构成的集合

rs1.copy() 浅拷贝

#其它记录集操作

record in recordset 检测一个记录是否在一个记录集中

record not in recordset 检测一个记录是否不在一个记录集中

recordset.ids 记录 ID 集

recordset.ensure\_one() 检测是一个记录

recordset.exists() 若存在返回一个备份

recordset.filtered(func) 过滤记录集

recordset.mapped(func)

recordset.sorted(func) 排序后

```
# filtered()
```

```
def filtered(self, func):
```

```
    recset.filtered(lambda record: record.company_id == user.company_id)
```

只保留是当前用户公司的记录

```
    recset.filtered("product_id.can_be_sold")
```

保留可销售的产品

```
# sorted()
```

```

def sorted(self, key=None, reverse=False):
    recset.sorted(key=lambda r: r.name)
    按记录集中的名称字段升序排序

#先按照按 partner_id 排序，然后用 name 排序
from operator import attrgetter
recset.sorted(key=attrgetter('partner_id', 'name'))

# mapped()
def mapped(self, func):
    recset.mapped(lambda record: record.price_unit - record.cost_price)

# 从记录集抽出 name 这一列再组成记录集
recset.mapped('name')

# 返回合作伙伴记录集
    recset.mapped('invoice_id.partner_id')

* 特殊记录集 ids 属性

* 一些记录的操作
    # 得到记录的显示名称
    name_get() 方法 对应的字段是 display_name

* 环境操作
    # self.env 得到环境 这是一个很有用的东西
    def afun(self):
        self.env
    # or
    model.env

#修改环境
    def with_context(self, *args, **kwargs)
    self.env['res.partner'].with_context(tz=x).create(vals)
    不能用这个函数来修改当前的环境

# 替换整个环境
    def with_env(self, env)
    with_env()

# 切换用户
    def sudo(self, user=SUPERUSER_ID):
    self.sudo(user.id)

```

```

self.sudo() # 会切换到超级用户
# or
self.env['res.partner'].sudo().create(vals)

# 得到用户
self.env.user 得到当前用户记录
self.env.uid 或 self._uid 得到当前用户在数据表中的 id

# 得到游标（这是操作数据表的基础）
self.env.cr 或 self._cr

# 得到上下文（得到状态数据）
self.env.context 或 self._context

# 得到给定模型的实例（重点业务操作）
self.env[model_name]
model_name ,像 res.users res.partner 等可以到后台查到

# 得到 xml 的记录
self.env.ref('base.main_company')

# 清理环境缓存
self.env.invalidate_all()

* 模型中的常用操作(v7,v8 都可以调用，采用的调用形式不一样，返回的结果不一样)
  这些是模弄预定义的方法
  可以 openerp/models.py 中的 BaseModel 类中的定义的方法
  其中有一段：
  _cr = property(lambda self: self.env.cr)
  _uid = property(lambda self: self.env.uid)
  _context = property(lambda self: self.env.context)

  这样继承模型，就可以用 self._cr self._uid self._context

# 基本方法 create, search, search_count, read, search_read, browse, write,
unlink,copy

-----
create:创建一条记录

@api.model

```

```
@api.returns('self', lambda value: value.id)
```

```
def create(self, vals):
```

```
    pass...
```

vals 是一个字典数据类型 {'key': 'value'}

v8 调用 create(vals) 返回创建的记录

v7 调用 create(cr, uid, vals, context=None) 返回创建记录的 id

例子:

```
v8: self.env.get('res.users').create({'name': 'New name'})
```

```
v7: self.pool['stock.transfer_details'].create(cr, uid, {'picking_id':  
len(picking) and picking[0] or False}, context)
```

-----

write: 写入记录

```
@api.multi
```

```
def write(self, vals):
```

```
def _write(self, cr, user, ids, vals, context=None)
```

vals: 是一个字典数据类型 {'key': 'value'}

v8 调用 write(vals) 返回 True

v7 调用 write(cr, uid, vals, context=None)

例子:

```
v8: self.write({'x': 1, 'y': 2, 'z': 4})
```

```
v7: self.write(cr, uid, processed_ids, {'processed': 'true'},  
context=context)
```

-----

search: 指定条件搜索记录

```
@api.returns('self',
```

```
    upgrade=lambda self, value, args, offset=0, limit=None, order=None,  
count=False: value if count else self.browse(value),
```

```
    downgrade=lambda self, value, args, offset=0, limit=None, order=None,  
count=False: value if count else value.ids)
```

```
    def search(self, cr, user, args, offset=0, limit=None, order=None,  
context=None, count=False):
```

```
        pass...
```

args 是搜索条件 是 domain 表达式

offset 记录第几个 (int)  
limit 返回几个(int)  
order 指定排序字段(str)  
count 为真, 则只返回记录集总数 (bool)

v8 调用 search(args[, offset=0][, limit=None][, order=None][, count=False]) 返回记录集

v7 调用 search(self, cr, user, args, offset=0, limit=None, order=None, context=None, count=False) 返回记录集 ids

例子:

v8: self.env.get('res.users').search([('is\_company', '=', True)])

v7: self.pool.get('stock.config.settings').search(cr, uid, [], limit=1, order='id DESC', context=context)

-----

search\_count:指定条件搜索记录数

```
def search_count(self, cr, user, args, context=None):  
    pass...
```

args 是搜索条件 是 domain 表达式

v8 调用 search(args)

v7 调用 search\_count(self, cr, user, args, context=None)

例子:

v8: self.env.get('res.users').search\_count([('is\_company', '=', True)])

v7: self.pool.get('account.move.line').search\_count(cr, uid, [('asset\_id', '=', asset\_id)], context=context)

-----

read:读取记录集中指定字段 返回字典列表 (记录)

@api.v7

```
def read(self, cr, user, ids, fields=None, context=None,  
load='_classic_read'):  
    pass...
```

若有多个返回记录的字典列表, 若一个就返回一个记录, 没有就返回 false

@api.v8

```
def read(self, fields=None, load='_classic_read'):  
    pass...
```

若有多个返回记录的字典列表，没有就返回空列表[]

**fields:** 字段列表，默认是全部字段(list)

v8 调用 read(fields)

v7 调用 read(self, cr, user, ids, fields=None, context=None)

例子:

```
v8:self.env['res.users'].read([], ['name'])
```

```
v7:self.read(cr, uid, ids, ['product_qty'])
```

-----

**search\_read:**搜索并读取指定字段，合了 search()和 read()方法

resolve\_o2m\_commands\_to\_record\_dicts = resolve\_2many\_commands

```
def search_read(self, cr, uid, domain=None, fields=None, offset=0,
limit=None, order=None, context=None):
    pass...
```

**domain:** 条件表达式

**fields:** 字段列表，默认是全部字段(list)

**offset** 记录第几个 (int)

**limit** 返回几个(int)

**order** 指定排序字段(str)

v8 调用 self.search\_read(domain=None, fields=None)

v7 调用 self.search\_read(self, cr, uid, domain=None, fields=None, offset=0, limit=None, order=None, context=None)

例子:

```
v8: self.env['res.users'].search_read([], ['name'])
```

```
v7: self.pool.get('stock.picking.type').search_read(cr, uid, [],
['sequence'], order='sequence desc')
```

-----

**browse:** 指定 ids 搜索记录集

@api.v7

```
def browse(self, cr, uid, arg=None, context=None):
```

@api.v8

```
def browse(self, arg=None):
```

args 记录的 ids (list)

v8 调用 self.browse(args)

v7 调用 self.browse(self, cr, uid, arg=None, context=None)

例子:

v8: self.env['res.users'].self.browse([1, 2, 3])

v7: self.pool.get('stock.quant').browse(cr, uid, quant\_ids,  
context=context)

-----

unlink: 记录删除

def unlink(self, cr, uid, ids, context=None):

ids: 记录 ID 集 (list)

v8 调用 self.unlink(ids) 返回一个新记录

v7 调用 self.unlink(self, cr, uid, ids, context=None) 返回一个新记录 id

例子:

v8: self.unlink([operation\_id])

v7: self.unlink(cr, uid, [operation\_id], context=context)

-----

copy: 复制记录

分为记录拷贝和记录集拷贝

记录拷贝:

@api.one

记录集拷贝

@api.multi

@api.returns('self', lambda value: value.id)

def copy(self, cr, uid, id, default=None, context=None):

v8 调用 self.copy(args) 返回一个新记录

v7 调用 self.copy(self, cr, uid, id, default=None, context=None) 返回一个新  
记录 id

例子:

v8: self.copy(move.id)

v7: self.copy(cr, uid, move.id, default\_val)

# 得到指定字段默认值:

```
@api.model
```

```
def default_get(self, fields_list):
```

返回指定字段默认的字典列表

v8 调用 `default_get(fields_list)`

v7 调用 `default_get(self, cr, uid, fields, context=None)`

例子:

```
v8: self.default_get({'reception_steps', 'delivery_steps'})
```

```
v7: self.default_get(cr, uid, {'reception_steps', 'delivery_steps'})
```

# 得到记录的显示名:

```
@api.multi
```

```
def name_get(self):
```

```
pass...
```

这个方法会覆盖:

<https://github.com/odoo/odoo/blob/8.0/addons/event/event.py#L194>

v8 调用 `self.name_get()`

v7 调用 `self.name_get(cr, user, ids, context=null)` 一般重写了, 加入了 ids

例子:

```
v8:
```

```
v7:
```

# 创建只有 `display_name` 的记录

```
@api.model
```

```
def name_create(self, name):
```

返回创建好的记录的 [(id,name)]

v8 调用 `self.name_create()`

v7 调用 `self.name_create(cr, user, name, context=null)` 一般重写了, 加入了 ids

# 根据 `display_name` 来搜索

```
@api.model
```

```
def name_search(self, name="", args=None, operator='ilike', limit=100):
```

```
pass...
```

**name:**给定比较的 name (str)  
**args:domain:** 条件表达式  
**operator:** name 用来的比较操作符  
**limit:**限定返回记录数目

v8 调用 self.name\_search(name[,args][,operator][,limit])  
 v7 调用 self.name\_search(cr, user,name[,args][,operator][,limit], context=null)

# 得到批定字段特定语言的字符串  
 def read\_string(self, cr, uid, id, langs, fields=None, context=None):

# 写入批定字段特定语言的字符串  
 def write\_string(self, cr, uid, id, langs, vals, context=None):

# 清除记录的缓存  
 def clear\_caches(self):

# 按分组列表记录  
 def read\_group(self, cr, uid, domain, fields, groupby, offset=0, limit=None, context=None, orderby=False, lazy=True):

cr: 数据游标  
 uid: 当前用户 id  
 domain: domain: 条件表达式  
 fields: 列出来显示的字段 (list)  
 groupby: 列出用来分组的字段(list)  
 offset: 结果集的起点,第几条开始(int)  
 limit: 最多显示几条(int)  
 context: 上下文  
 orderby: 字段排序列表(list)  
 lazy: 延迟加载(bool)  
 返回字典列表

# 得到字段的权限  
 def check\_field\_access\_rights(self, cr, user, operation, fields, context=None):

# 特殊字段操作方法: perm\_read, perm\_write  
 def perm\_read(self, cr, uid, ids)

```

def perm_write(self, cr, uid, ids, fields)

# 字段(fields)和视图(views)操作方法: fields_get, distinct_field_get,
fields_view_get
def fields_get(self, cr, user, allfields=None, context=None,
write_access=True, attributes=None)
def fields_view_get(self, cr, uid, view_id=None, view_type='form',
context=None, toolbar=False, submenu=False)
def distinct_field_get(self, cr, uid, field, value, args=None, offset=0,
limit=None)

```

```

# 记录写
@api.one
...
self.write({'key': value })
# or
record.write({'key': value})
写入没有返回值
@api.multi
def do_mass_update(self):
    self.ensure_one()
    if not (self.new_deadline or self.new_user_id):
        raise exceptions.ValidationError('No data to update!')
    # else:
    _logger.debug('Mass update on Todo Tasks %s',
        self.task_ids.ids)
    if self.new_deadline:
        self.task_ids.write({'date_deadline': self.new_deadline})
    if self.new_user_id:
        self.task_ids.write({'user_id': self.new_user_id.id})
    return True

```

self.ensure\_one() 检测单例

```

# 检查记录对象存在 exists()
if not record.exists():
    raise Exception("The record has been deleted")

```

```

# 外 id 引用
>>> env.ref('base.group_public')

```

```

res.groups(2)

#保证记录单例 ensure_one
records.ensure_one()
# is equivalent to but clearer than:
assert len(records) == 1, "Expected singleton"

# 记录集写
@api.multi
...
self.write({'key': value })
# It will write on all record.
self.line_ids.write({'key': value })

# Many2many One2Many 的行为
self.line_ids.create({'name': 'Tho'}) #
self.line_ids.create({'name': 'Tho', 'order_id': self.id}) #
self.line_ids.write({'name': 'Tho'}) # 保存所有的相关记录

# 删除
>>> rec = Partner.search([('name', '=', 'ACME')])
>>> rec.unlink()

# 抛出异常终止
raise Exception(
    "You can not export the column ID of model %s, because the "
    "table %s is not an ordinary table."
    % (self._name, self._table))
这个方式也可用来调试代码变量

* 使用数据库操作游标
def my_fun(self):
    cursor = self._cr
    # or
    self.env.cr

* 保用线程
with Environment.manage(): # class function
    env = Environment(cr, uid, context)

```

\* 打印时间处理，主要是时区

```
dt = datetime.datetime.strptime(str, '%Y-%m-%d %H:%M:%S')
dt =
dt.replace(tzinfo=pytz.utc).astimezone(pytz.timezone('Asia/Shanghai'))
return dt.strftime(fmt.encode('utf-8')).decode('utf-8')
```

这个主要的是解决打印时间的显示的和实际时间的差别，

## (04)odoo 视图操作

### \* 视图标签类型

# <record>标签有属性 model="ir.ui.view" ,它包含本身的视图定义

# <record>标签有属性 model="ir.actions.act\_window",它将动作和视图链接起来

# <menuitem>标签, 把菜单和动作链接起来

### \* 模板 (Templating)

```
<template id="..." name="...">
    html
</template>
```

```
-----
<record id="..." model="ir.ui.view">
    <field name="name">...</field>
    ...
    <field name="arch" type="xml">
        html
    </field>
</record>
```

### # 渲染模板

```
http.request.render(template[,values])
```

```
@http.route('/hello/')
def hello(self, **kw):
    return http.request.render(module.hello)
```

```
-----
<template id="hello">
    <p> hello , <t t-esc="name"/></p>
</template>
```

```
-----
return http.request.render(module.hello,{'name':"World"}) # 带参数
```

### # Qweb 设置变量值

```
<template id="hello">
    <t t-set="greet" t-value="name+'!!!'">
    <p> hello , <t t-esc="greet"/></p>
</template>
```

```
-----
```

```

<template id="hello">
  <t t-set="greet" t-value="{{name}}!!!">
    <p> hello , <t t-esc="greet"/> </p>
</template>

```

-----

原样输出

```

<template id="hello">
  <t t-set="greet">
    <em>Hello</em>, <t t-esc="name"/>
  </t>
  <p> hello , <t t-raw="greet"/> </p>
</template>

```

# Qweb 语句

条件语句

```

<template id="hello">
  <p>
    <span t-if="name=='World'" />
      Hello World!
    </span>
  </p>
</template>

```

-----

```

<template id="hello">
  <t t-set="condition" t-value="name=='World'">
    <p>
      <span t-if="condition" />
        Hello World!
      </span>
    </p>
    <p>
      <span t-if=" not condition" />
        Hello not World!
      </span>
    </p>
  </template>

```

循环语句

```

<template id="hello">
  <ul>
    <li t-foreach="name" t-as="letter">

```

```

        <t t-esc="letter_index"/>:<t t-esc="letter" />
    </li>
</ul>
<template>
-----
<t t-foreach="seq" t-as="value">
* value 项值
* value_size 大小
* value_all 总数
* value_index 索引号
* value_first:bool 第一个
* value_last:bool 最后一个
* value_parity:'even'/'odd' 当前是第奇数还是偶数

```

调用其它模板

```

采用 t-call
<template id="sub">
    <t t-esc="identifier" />
</template>
<template id="hello">
    <p>
        hello,
        <t t-call="module.sub">
            <t t-set="identifier" t-value="name" />
        </t>
    </p>
</template>

```

属性设置

```

t-att-{attname}="{expression}"
t-attf-{attname}="{expression}"
-----
<template id="hello">
    <p t-att-class="name.lower()">Hello,world</p>
    <p t-attf-class="cl-{{name.lower()}}">Hello,world</p>
</template>

```

字段渲染

```

@http.route('hello/<model("res.users"):user') # 给用户的 id 即可
def hello(self,user,**kw)
    return http.request.render('module.hello',{'user':user})

```

```

-----
<template id="hello">
  <p t-field="user.display_name" />
</template>

```

可用字段选择修饰

```

<template id="hello">
  <p t-field="user.creat_date" />
  <p
t-field="user.creat_date" t-filed-options='{ "format": "long" }' />
  <p t-field="user.creat_date" t-filed-options='{ "format": "EEE" }' />
</template>

```

```

-----
<template id="hello">
  <p t-field="user.wealth" />
  <p t-field="user.wealth" t-filed-options='{
    "widget": "monetary"
    "display_currency": "user.company_id.currency_id"
  }' />
</template>

```

```

-----
<template id="hello">
  <p t-field="user.create_date"
t-field-options='{ "widget": relative }' />
</template>

```

模板继承

```

<template id="hello">
  <p> Base template </p>
</template>
<template id="hello2" inherit_id="hello" name="Extender">
  <xpath expr="//p" position="before">
    <h1>Extended!</h1>
  </xpath>
</template>

```

得到的结果:

```

<h1>Extended!</h1>
<p>Base template</p>
-----
<template id="hello">
  <p class="a">A</p>

```

```

    <p class="b">B</p>
</template>
<template id="hello2" inherit_id="hello" name="Extender">
    <xpath expr="//p[class('b')]" position="before">
        <h1>Extended!</h1>
    </xpath>
</template>

```

得到的结果:

```

<p class="a">A</p>
<h1>Extended!</h1>
<p class="b">B</p>

```

-----

调用系统的基础模板:

```

<template id="hello">
    <t t-call="website.layout">
        <p class="a">A</p>
        <p class="b">B</p>
    </t>
</template>
<template id="hello2" inherit_id="hello" name="Extender">
    <xpath expr="//p[class('b')]" position="before">
        <h1>Extended!</h1>
    </xpath>
</template>

```

-----

#### \* 视图

```

<record id="view_id" model="ir.ui.view">
    <field name="name">view.name</field>
    <field name="model">object_name</field>
    <field name="type">form</field>
    <field name="priority" eval="16" />
    <field name="arch" type="xml">
        <!-- view content <form>,<tree>,<graph>,... -->
    </field>
</record>

```

属性:

openerp/addons/base/ir/ir\_ui\_view.py view 类中的\_columns

model: 固定为 ir.ui.view

id 唯一, 调用和继承会用到

name 视图名称

model 对象

type 有多种类型 tree,form,graph,calendar,digram,gant,kanban,search

priority 排序

\* 视图继承:

```
<record model="ir.ui.view" id="view_partner_form">
  <field name="name">res.partner.form.inherit</field>
  <field name="model">res.partner</field>
  <field name="inherit_id" ref="base.view_partner_form" />
  <field name="arch" type="xml">
    <notebook position="inside">
      <page string="Relations">
        <field name="relations_ids" colspan='4' nolabel="1" />
      </page>
    </notebook>
  </field>
</record>
```

所有的操作只能在

```
<field name="arch" type="xml">... </field>
```

定位 4 种属性

@ inside(默认):附加在标签内

@ after:后添加内容标签

@ before:前的内容标签

@ replace: 更换标签内容

支持定位方法:

```
<notebook position="inside">
  <xpath expr="//page[@name='page_history']" position="inside">
  <field name="mobile" position="after">
  <filter name="consumable" position="after">
  <group name="bank" position="after">
  <xpath expr="//field[@name='standard_price']" position="replace">
  <xpath expr="//button[@name='open_ui']" position="replace">
  <xpath expr="//div[@class='oe_employee_details']/h4/a"
position="after">
  <xpath
expr="//form/sheet/notebook/page/field[@name='line_ids']/tree/field[@name='analytic_account_id']"
  position="replace">
  <xpath
```

```
expr="/form/sheet/notebook/page/field[@name='line_ids']/form/group/field[
@name='analytic_account_id']"
```

```
position="replace">
```

```
# 更换内容:
```

```
<record model="ir.ui.view" id="view_partner_form1">
  <field name="name">res.partner.form.inherit1</field>
  <field name="model">res.partner</field>
  <field name="inherit_id" ref="base.view_partner_form" />
  <field name="arch" type="xml">
    <page string="Extra Info" position="replace">
      <field name="relations_ids" colspan='4' nolabel="1" />
    </page>
  </field>
</record>
```

```
# 删除内容:
```

```
<record model="ir.ui.view" id="view_partner_form2">
  <field name="name">res.partner.form.inherit2</field>
  <field name="model">res.partner</field>
  <field name="inherit_id" ref="base.view_partner_form" />
  <field name="arch" type="xml">
    <field name="lang" position="replace"/>
  </field>
</record>
```

```
# 插入内容
```

```
<record model="ir.ui.view" id="view_partner_form3">
  <field name="name">res.partner.form.inherit3</field>
  <field name="model">res.partner</field>
  <field name="inherit_id" ref="base.view_partner_form" />
  <field name="arch" type="xml">
    <field name="lang" position="before">
      <field name="relation_ids" />
    </field>
  </field>
</record>

<record model="ir.ui.view" id="view_partner_form4">
  <field name="name">res.partner.form.inherit4</field>
  <field name="model">res.partner</field>
  <field name="inherit_id" ref="base.view_partner_form" />
  <field name="arch" type="xml">
```

```

        <field name="lang" position="after">
            <field name="relation_ids" />
        </field>
    </field>
</record>

```

# 多变化

```

<record model="ir.ui.view" id="view_partner_form5">
    <field name="name">res.partner.form.inherit5</field>
    <field name="model">res.partner</field>
    <field name="inherit_id" ref="base.view_partner_form" />
    <field name="arch" type="xml">
        <field name="lang" position="replace"/>
        <field name="website" position="after">
            <field name="lang" />
        </field>
    </field>
</record>

```

# xpath 的节点

```

<record model="ir.ui.view" id="view_partner_form6">
    <field name="name">res.partner.form.inherit6</field>
    <field name="model">res.partner</field>
    <field name="inherit_id" ref="base.view_partner_form" />
    <field name="arch" type="xml">
        <data>
            <xpath
expr="/feild[@name='address']/form/field[@name='email']"
            position="after">
                <field name="age" />
            </xpath>
            <xpath
expr="/field[@name='address']/tree/field[@name='email']"
            position="after">
                <field name="age" />
            </xpath>
        </data>
    </field>
</record>

```

\* 窗口操作(视图动作)

如下一些代码

```
<?xml version="1.0" encoding="utf-8" ?>
<openerp>
  <data>
    <act_window id="action_todo_stage"
      name="To-Do Task Stages"
      res_model="todo.task.stage"
      view_mode="tree,form" />

    <act_window id="todo_app.action_todo_task"
      name="To-Do Task "
      res_model="todo.task"
      view_mode="tree,form,calendar,gantt,graph"
      target="current"
      context="{ 'default_user_id':uid}"
      domain="[]"
      limit="80" />

    <act_window id="action_todo_task_stage"
      name="To-Do Task Stages"
      res_model="todo.task.stage"
      src_model="todo.task"
      multi="False" />
  </data>
</openerp>
```

可以用 `ir.action.act_window` 重新其中一菜单对角

```
<record id="action_todo_stage" model="ir.actions.act_window">
  <field name="name">To-Do Task Stage</field>
  <field name="type">ir.actions.act_window</field>
  <field name="domain">["list of 3-tuples (max 250 characters)"]</field>
  <field name="context">{"context dictionary (max 250
characters)"}</field>
  <field name="res_model">todo.task.stage</field>
  <field name="view_type">form</field>
  <field name="view_mode">tree,form</field>
  <field name="search_view_id" ref="todo_task_search"/>
  <field name="view_id" ref="view_form_todo_task_ui" />
</record>
```

窗口的动作是存在 `ir.actions.act_window` 模型中的，我们可以在 `xml` 文件中用 `<act_window>` 来快捷定义

下面是部分属性说明，完整的可以在 `openerp/addons/base/ir/ir_actions.py` 中的 `ir.actions.act_window`

类中可以找到

# name 显示的标题

# type 动作类型，默认 `ir.actions.act_window`

# view\_id 中的 ref 值是对应视图对象的 id 触发时用哪个视图

# context 设置目标视图的上下文

比如: `<field name="context">{'search_default_group_by_product': True, 'search_default_group_by_location': True}</field>`

`<!--默认搜索 以产品分组 和以库位分组-->`

# domain 过滤记录按条件，如: `[["customer", "=", true]]`

# res\_id: 当动作打开视图是表单视图时，要指定的加载记录 id, 只有 'view\_mode' 值为 form 时才有效

否则就会新建一个记录 如: `"res_id": a_product_id,`

# res\_model 动作响应的目标模型

# target 如果设置为 new 就打开新窗口，默认是 current

# view\_mode: 列出允许使用的视图模式 如 form, tree, calendar, etc 默认是 tree, form

# view\_type: 设定 tree 时的列表是树状还是普通列表， tree-树状 form-普通列表 缺省是 form

# usage: 过滤菜单和动作

# view\_ids:

# views: 是 (view\_id, view\_type) 元组对列表，第一组是动作默认打开的视图

如: `"views": [[False, "tree"], [False, "form"]]`

# limit 指列表视图时，一页的记录数，默认是 80

# auto\_refresh: 在视图中添加一个刷新功能

# groups\_id: 权限组

# search\_view\_id 指定响应的搜索视图(id, name) 元组对

# filter: 列表视图显示过滤器(bool)

# auto\_search: 加载默认视图后，自动搜索

# src\_model 指定可以启动视图的更多按钮

# multi 设为 True, 更多按钮显示在列表视图，否则显示在表单视图

系统的默认值:

```
_defaults = {
    'type': 'ir.actions.act_window',
    'view_type': 'form',
    'view_mode': 'tree,form',
    'context': '{}',
    'limit': 80,
```

```

'target': 'current',
'auto_refresh': 0,
'auto_search': True,
'multi': False,
}

```

#### \* 菜单项

如下一些代码

```

<menuitem id="menu_todo_task_main"
          name="To-Do" parent="mail.mail_my_stuff"/>
<menuitem id="todo_app.menu_todo_task"
          name="To-Do Tasks"
          parent="menu_todo_task_main"
          sequence="10"
          action="todo_app.action_todo_task"/>
<menuitem id="menu_todo_task_stage"
          name="To-Do Stages"
          parent="menu_todo_task_main"
          sequence="20"
          action="action_todo_stage"/>

```

在 设置-> 技术-> 用户界面-> 菜单 可以看到已定义的菜单

菜单是存在 `ir.ui.menu` 模型中的，我们可以在 xml 文件中用 `<menuitem>` 来快捷定义

`openerp/addons/base/ir/ir_ui_menu.py`

```

# id 菜单的唯一 id 用于父子级别和调用
# name 在视图中显示的名字 如果定义的 action,这个可以省略，会用对应 action
    的 name 值
# sequence 显示排序
# parent 本菜单的父菜单，子菜单都要指定，只有顶级菜单不要指定
# action 本菜单的连接动作
# groups 指定权限组，用户组的 extraID

```

这里的 `action` 要关联到视图动作定义中的 `id`

如 `action="action_todo_stage"` 对应视图动作中的 `id="action_todo_stage"`

\* 三个主要的视图 `list` 或 `tree`(树状)视图， 表单 `form` 视图， `search` 搜索视图 对应模型 `ir.ui.view`

在 `openerp/addons/base/ir/ir_ui_view.py` 中可以看到有 `tree, form, graph,`

calendar, diagram

gantt,kanban, search,qweb 这些视图

\* 表单视图

# 添加在动作和菜单项后面 <act\_window><menuitem>

代码如下:

```
<record id="view_form_todo_task_ui" model="ir.ui.view">
  <field name="name">view_form_todo_task_ui</field>
  <field name="model">todo.task</field>
  <field name="arch" type="xml">
    <form>
      <header><!-- Buttons and status widget --></header>
      <sheet><!-- Form content --></sheet>
      <!-- History and communication: -->
      <div class="oe_chatter">
        <field name="message_follower_ids"
          widget="mail_followers"/>
        <field name="message_ids"
          widget="mail_thread"/>
      </div>
    </form>
  </field>
</record>
```

#包含三个可视域:

```
<header>
<sheet> 放内容的
<bottom> 历史记录和社交部分
```

# header 状态栏

```
<header>
  <field name="stage_state" invisible="True"/>
  <button name="do_toggle_done" type="object"
    attrs="{ 'invisible':
      [ ('stage_state', 'in', [ 'done', 'cancel' ] ) ] }"
    string="Toggle Done" class="oe_highlight"/>
  <!-- Add stage statusbar: ... -->
```

```
</header>
```

@ class="oe\_highlight" 加高亮

@ invisible 为可见性, 还可以用到其它元素上, 不仅在<bottom>上

-----

```
<header>
  <field name="state" widget="statusbar" nolabel="1"/>
```

</header>

@ 加入状态挂件

# 元素功能分组排列

group 分组的特性

@ colspan 说明该控件占用父容器多少列 openerp form 为顶级容器，约定为 4 列

colspan 缺省是 2

@ rowspan 行数

@ expand

@ col 用于容器控件，如 group 表示这个容器内部分几列

@ string 组的名称

@ openerp 控件一般都有 label 这样占两列

举一例：

①<group col="6" colspan="4">

②<group col="2" colspan="4">

<separator colspan="2" string="Product Description"/>

<field name="name" select="1">

<field groups="base.group\_extended" name="variants"

select="2" />

</group>

③<group col="2" colspan="1">

<separator colspan="2" string="Codes"/>

<field name="default\_code" select="1">

<field groups="base.group\_extended" name="ean13"

select="2" />

</group>

④<group col="2" colspan="1">

<separator colspan="2" string="Product Type"/>

<field name="sele\_ok" select="2">

<field name="purchase\_ok" select="2">

<field groups="base.group\_extended" name="rental"

select="2" />

</group>

</group>

① colspan="4" 占据了整行，col="6" 表示①这个组控件内分为 6 列

② col="2" 表示②这个组控件内分为 2 列， colspan="4" 表示占①组控件 4

列

③ col="2" 表示③这个组控件内分为 2 列， colspan="1" 表示占①组控件 1

列

④ col="2" 表示④这个组控件内分为 2 列， colspan="1" 表示占①组控件 1

列

注:

加了<group>...</group>, 里面的 field 会自动加上<label>

<group>顶级是默认里面分为 4 列

<group>子级里面默认是 2 列, 这样<label> 占一列, <field>值占一列

<group>里面的 field 不要加<label>要指明, 如:

<group string="Source Term">

<field name="source" nlabel="1" height="400"/>

</group>

#### \* 视图元素

#按钮<button>, 支持的属性

icon 可用的 icon 在 addons/web/static/src/img/icons

string 按钮的显示文字

type 值可以是 workflow, object action

name 就是要触发的方法标识

args 传递方法的参数

content 上下文

confirm 针对对话框的确认

special="cancel" 用于向导

例子:

<footer>

<button name="act\_update" string="Update" type="object"  
class="oe\_highlight"/>

or

<button special="cancel" string="Cancel" type="object"  
class="oe\_link"/>

</footer>

#字段<field>, 支持的属性

name 字段技术名

string 显示名

help 帮助提示

placeholder 占位文字

widget 小物件

options 小物件对应的选项

class 加载类名

`invisible="1"` 标识不可见  
`nolabel="1"` 不显示标签，会用于<group>之内  
`readonly="1"` 标识只读  
`required="1"` 标识不能为空

`sum,avg` 小计，平均值  
`password="True"` 密码框  
`filename` 文件上传用  
`mode="tree"` One2many 字段

# 关联字段  
`options={'no_open':True,'no_create':True}`  
常用于 `context` 和 `domain` 中

# 小物件  
用于文本字段  
`email url html`  
用于数字字段  
`float_time monetary progressbar`  
用于关联和选择  
`many2many_tags`  
`selection`  
`radio`  
`kanban_state_selection`  
`priority`

\* 事件变化  
`@api.onchange('field1','field2')`

\* 动态视图  
# `group`  
# `states`  
增加灵活性 用 `refers_to`  
`<field name="refers_to"`  
    `attrs="{ 'invisible': [ ('state','=','draft') ] }" />`

\* 列表视图（分为两种，正常列表，和树状列表）  
`<record id="todo_app.view_tree_todo_task" model="ir.ui.view">`  
    `<field name="name">To-do Task Tree</field>`  
    `<field name="model">todo.task</field>`  
    `<field name="arch" type="xml">`  
        `<tree editable="bottom"`  
            `colors="gray:is_done==True"`

```

        fonts="italic: state!='open'" delete="false">
    </field name="name"/>
    <field name="user_id"/>
</tree>
</field>
</record>

```

# <tree>

属性:

**editable** 设置字段在列表直接可以编辑

例: <tree string="Translations" editable="top">

**colors** 按条件设定记录的颜色

**toolbar** 设置为 True,会显示层次结构像菜单一样

**fonts** 按条件设定记录的字体

**create,delete,edit** 若设置为 false 则为不可用

允许元素:

field, group, separator, tree, button, filter, newline

# 当不要创建和编辑功能时, 在<tree> 加上 create="0"

看一下树状列表, 以产品分类为例:

```

    <record id="product_category_tree_view" model="ir.ui.view">
    <field name="name">product.category.tree</field>
    <field name="model">product.category</field>
    <!--父子 -->
    <field name="field_parent">child_id</field>
    <field name="arch" type="xml">
        <tree toolbar="True" string="Product Categories">
            <field name="name"/>
        </tree>
    </field>
</record>
<!--产品分类动作 -->
<record id="product_category_action" model="ir.actions.act_window">
    <field name="name">Products by Category</field>
    <field name="type">ir.actions.act_window</field>
    <field name="res_model">product.category</field>
    <field name="domain">[('parent_id','=',False)]</field>
    <!--采用树状-->
    <field name="view_type">tree</field>

```

```

<field name="view_id" ref="product_category_tree_view"/>
<field name="help" type="html">
    <p>
        Here is a list of all your products classified by category. You
        can click a category to get the list of all products linked to
        this category or to a child of this category.
    </p>
</field>
</record>
@可以看到: <field name="view_type">tree</field>
@视图中用到 <field name="field_parent">child_id</field>

```

#### \* 搜索视图

代码如下(产品模板的搜索视图):

```

<record id="product_template_search_view" model="ir.ui.view">
    <field name="name">product.template.search</field>
    <field name="model">product.template</field>
    <field name="arch" type="xml">
        <search string="Product">
            <!--产品搜索-->
            <field name="name" string="Product"
filter_domain="[('default_code','ilike',self),('name','ilike',self)]"/>
            <!--过滤-->
            <filter string="Services" icon="terp-accessories-archiver"
domain="[('type','=', 'service')]" />
            <filter string="Consumable" name="consumable"
icon="terp-accessories-archiver" domain="[('type','=', 'consu')]"
help="Consumable products"/>
            <separator/>
            <!--可销售-->
            <filter string="Can be Sold" name="filter_to_sell"
icon="terp-accessories-archiver-minus" domain="[('sale_ok','=',1)]"/>
            <!--产品分类-->
            <field name="categ_id" filter_domain="[('categ_id', 'child_of',
self)]"/>
            <field string="Product Variant" name="product_variant_ids"
filter_domain="[('product_variant_ids.name','ilike',self),
('product_variant_ids.attribute_value_ids.attribute_id.name','ilike',self)]"/>
            <!--公司-->

```

```

    <field name="company_id"/>
    <!--价格表-->
    <field name="pricelist_id" widget="selection" context="{ 'pricelist':
self}" filter_domain="[]" groups="product.group_sale_pricelist"/><!-- Keep
widget=selection on this field to pass numeric `self` value, which is not the
case for regular m2o widgets! -->

    <group expand='0' string='Group by... '>
        <!--分类-->
        <filter string='Category' domain="[]" context="{ 'group_by' :
'categ_id' }"/>
        <!--默认计量单位-->
        <filter string='Default Unit of Measure' icon="terp-mrp"
domain="[]" context="{ 'group_by' : 'uom_id' }"/>
        <!--类型-->
        <filter string='Type' icon="terp-stock_symbol-selection"
domain="[]" context="{ 'group_by' : 'type' }"/>
    </group>
</search>
</field>
</record>

```

# <search>

上面用于搜索字段 name default\_code

**field** 元素定义的属性

**name** 字段标识名

**string** 标签名

**operator** 操作符

**filter\_domain** 对应字段如何对输入内容搜索

上面的例子基于 **name** 字段搜索时, 输入框内容和 **name** 和 **default\_code** 都比较有一个满足就可以

**filter** 元素支持属性(过滤器)

**name** 指定动作标识符 (在模型中会定义的方法名)

**string** 标签名

**domain** 过滤记录按条件

**content** 上下文

**group** 用于分组

它的单项类似 **filter**,但重点用了 **context** 来分组

\* 日历视图

```
<record id="view_calendar_todo_task" model="ir.ui.view">
  <field name="name">view_calendar_todo_task</field>
  <field name="model">todo.task</field>
  <field name="arch" type="xml">
    <calendar date_start="date_deadline" color="user_id"
      display="[name], Stage [stage_id]">
      <!-- Fields used for the text of display attribute -->
      <field name="name"/>
      <field name="stage_id"/>
    </calendar>
  </field>
</record>
#<calendar>
  date_start 开始日期
  date_stop 结束日期
  date_delay 延期
  color 用颜色的实体
  all_day 总天数
  display 显示文字
  attendee 出席人
```

\* 甘特视图

```
<record id="view_gantt_todo_task" model="ir.ui.view">
  <field name="name">view_gantt_todo_task</field>
  <field name="model">todo.task</field>
  <field name="arch" type="xml">
    <gantt date_start="date_deadline"
      default_group_by="user_id"/>
  </field>
</record>

#<gantt>
  date_start 开始日期
  date_end 结束日期
  date_delay 周期
  progress 进度百分比
  default_group_by 任务分组条件
```

\* 图表视图

```
<record id="view_graph_todo_task" model="ir.ui.view">
  <field name="name">view_graph_todo_task</field>
  <field name="model">todo.task</field>
  <field name="arch" type="xml">
    <graph type="pivot">
      <field name="stage" type="col"/>
      <field name="user_id"/>
      <field name="date_deadline" interval="week"/>
      <field name="effort_estimate" type="measure"/>
    </graph>
  </field>
</record>
#<graph>
  type:bar,pie(默认),pivot 类型: 条形, 饼图
  orientation:horizontal,vertical 方向: 水平 垂直
  字段支持的属性<field>
  name 字段标识名
  type 分组方式, 默认是 row 行 , 设定可以是 col 列
  interval 时间度量 day,week,month,quarter 或 year
```

\* 看板

```
todo_task.py
-----
# -*- coding: utf-8 -*-

from openerp import models, fields

class TodoTask(models.Model):
    _inherit = 'todo.task'
    priority = fields.Selection(
        [('0', 'Low'), ('1', 'Normal'), ('2', 'High')],
        'Priority', default='1')
    kanban_state = fields.Selection(
        [('normal', 'In Progress'),
         ('blocked', 'Blocked'),
         ('done', 'Ready for next stage')],
        'Kanban State', default='normal')
-----
```

todo\_view.xml

```

-----
<?xml version="1.0"?>
<openerp>
  <data>
    <!-- Add Kanban view mode to the menu Action: -->
    <act_window id="todo_app.action_todo_task"
      name=" To-Do Tasks"
      res_model="todo.task"
      view_mode="kanban,tree,form,calendar,gantt,graph"
      context="{ 'search_default_filter_my_tasks': True }"/>
    <!-- Add Kanban view -->
    <record id="To-do Task Kanban" model="ir.ui.view">
      <field name="name">To-do Task Kanban</field>
      <field name="model">todo.task</field>
      <field name="arch" type="xml">
        <!-- Empty for now, but the Kanban will go here! -->
        <kanban>
          <templates>
            <t t-name="kanban-box">
              <div class="oe_kanban_vignette">
                
              <div class="oe_kanban_details">
                <!-- Title and Data content -->
                <h4>
                  <a type="open">
                    <field name="name"/>
                  </a>
                </h4>
                <field name="tags"/>
                <ul>
                  <li>
                    <field name="user_id"/>
                  </li>
                  <li>
                    <field name="date_deadline"/>
                  </li>
                </ul>
                <field name="kanban_state"
widget="kanban_state_selection"/>
              </div>
            </t>
          </templates>
        </kanban>
      </field>
    </record>
  </data>
</openerp>

```

```

        <field name="priority" widget="priority"/>
    </div>
</div>
</t>
</templates>
</kanban>
</field>
</record>
</data>
</openerp>

```

#### # 看板视图的风格

**Vignette** 就是左边有一个小插件，在系统中常用于 客户、产品、等  
**Card** 常用于 CRM 中的机会和商机，也用在项目任务

#### # 看板视图

**<kanban>** 顶级元素

常用两个字段 **priority** , **kanban\_state**

**priority** 显示项目的紧急程度

**kanban\_state** 显示项目的各阶段

**<templates>** 主要有一个命名 **kanban-box** 采用下面的元素 **<t**

**t-name="kanban-box">...</t>**

**<field>** 这是字段，若是只是用于表达，就放在 **<templates>** 之前，字段具有聚合性

如：

```
<field name="effort_estimated" sum="Total Effort" />
```

**<kanban>** 顶级元素支持一些属性

**default\_group\_by** 默认分组条件

**default\_order** 默认排序条件

**quick\_create="false"** 不能快速创建选项

**class** 加入 **css** 类

**css** 类，有两个主要的 **oe\_kanban\_vignette** 和 **oe\_kanban\_details**

**<img>** 中的 **t-att-src** 可以计算图片的 **src** 存在数据库中的值

#### # 在看板视图中的动作

在 **<a>** 中有 **type** 属性 像 **<button>** 里面的功能似的

**type** 的值有：

**open**: 打开表单视图

**edit**: 打开并编辑表单视图

**delete**: 删除记录

#卡片风格的看板视图

示例代码:

```
<t t-name="kanban-box">
  <div class="oe_kanban_card">
    <div class="oe_dropdown_kanban oe_dropdown_toggle">
      <!-- Top-right drop down menu -->
    </div>
    <div class="oe_kanban_content">
      <!-- Option menu will go here! -->

      <h4>
        <a type="open">
          <field name="name"/>
        </a>
      </h4>
      <field name="tags"/>
      <ul>
        <li>
          <field name="user_id"/>
        </li>
        <li>
          <field name="date_deadline"/>
        </li>
      </ul>
      <div class="oe_kanban_bottom_right">
        <field name="kanban_state"
          widget="kanban_state_selection"/>
      </div>
      <div class="oe_kanban_footer_left">
        <field name="priority" widget="priority"/>
      </div>
    </div>
  </div>
</t>
```

\* 综合来一例

# 模型 lesson.py

# -\*- coding: utf-8 -\*-

```
from openerp import models, fields
class oecn_training_lesson(models.Model):
```

```

_name = 'oecn.training.lesson'
_description = u'OECD 培训课程'
_columns = {
    'name':fields.char( u'课程名',size=64,select=True),
    'date_start':fields.date(u'开始日期',select=True),
    'total_day':fields.float(u'总天数',digits=(16,1)),
    'teacher':fields.many2one('res.users',u'授课老师'),
    'students':fields.many2many('res.partner',string=u'学生'),
    'price':fields.float(u'价格',digits=(16,2)),
}

```

u 后面再加中文，这样不会乱码，显性指明编码

#视图 lesson\_view.xml

```

<?xml version="1.0" encoding="utf-8"?>
<openerp>
<data>
<!--定义表单视图-->
<record model="ir.ui.view" id="oecn_training_lesson_form_view">
    <field name="name">课程表单</field>
    <field name="type">form</field>
    <field name="model">oecn.training.lesson</field>
    <field name="arch" type="xml">
        <form>
            <group>
                <field name="name"/>
                <field name="date_start"/>
                <field name="total_day"/>
                <field name="price"/>
                <field name="teacher"/>
                <field name="students" colspan="4"/>
            </group>
        </form>
    </field>
</record>

<!--定义列表视图-->

```

```

<record model="ir.ui.view" id="oecn_training_lesson_tree_view">
  <field name="name">课程列表</field>
  <field name="type">tree</field>
  <field name="model">oecn.training.lesson</field>
  <field name="arch" type="xml">
    <tree>
      <field name="name"/>
      <field name="date_start"/>
      <field name="teacher"/>
      <field name="price" sum="合计"/>
    </tree>
  </field>
</record>

<!--定义视图动作-->
<record
model="ir.actions.act_window" id="action_oecn_training_lesson">
  <field name="name">课程</field>
  <field name="res_model">oecn.training.lesson</field>
  <field name="view_type">form</field>
  <field name="view_mode">form,tree</field>
  <field name="view_id" ref="oecn_training_lesson_tree_view"/>
</record>

<!--定义菜单-->
<menuitem id="oecn_menu" name="OECN"/>
<menuitem id="oecn_training_menu" name="OECN Training"
parent="oecn_menu"/>
  <menuitem id="oecn_training_lesson_menu" name="OECN Training
Lesson" parent="oecn_training_menu"
  action="action_oecn_training_lesson"/>

</data>
</openerp>

```

这样从菜单到响应完成，打开展开一个表单视图

视图动作到了 8.0 可以用采用 <act\_window> 标签来简写

=====

接着继承插件写法，给课程分配教室

# 模型 lesson.py

# -\*- coding: utf-8 -\*-

```

from openerp import models, fields
class oecn_training_lesson(models.Model):

    _inherit = 'oeen.training.lesson'

    _columns = {

        'classroom_id':fields.many2one('oeen.training.classroom','教室'),#添加一个教室属性，为多对一对象。

    }

```

教室模型 classroom.py

```
# -*- coding: utf-8 -*-
```

```

from openerp import models, fields
class oecn_training_classroom(models.Model):

    _name = 'oeen.training.classroom'
    _description = u'OEEN 教室'
    _columns = {
        'number':fields.char(u'编号', size=64, select=True),
        'capacity':fields.integer(u'容纳人数', select=True),
        'location':fields.char(u'地点', size=125, select=True),
    }

```

#视图 lesson\_view.xml

```

<?xml version="1.0" encoding="utf-8"?>
<openerp>
    <data>
        <!--OEEN 教室-->
        <record model="ir.ui.view"
id="oeen_training_lesson_from_inherit_classroom_view">
            <field name="name">课程教室继承视图</field>
            <field name="type">form</field>
            <field name="model">oeen.training.lesson</field>
            <field name="inherit_id"
ref="oeen_training.oeen_training_lesson_form_view"/>
            <field name="arch" type="xml">
                <field name="name" position="after">
                    <field name="classroom_id"/>
                </field>
            </field>
        </record>

```

```

    </data>
</openerp>

<field name="inherit_id"
ref="oecn_training.oecn_training_lesson_form_view"/>
这句就是继承，ref 指名要继承的视图 id
后面就找位置
<field name="name" position="after">
    <field name="classroom_id"/>
</field>
意思是在要继承的视图的 name 字段后（position="after"），添加一个教室字段。

# 教室的视图
<?xml version="1.0" encoding="utf-8"?>
<openerp>
    <data>
        <!--OECD 教室-->
            <record model="ir.ui.view"
id="oecn_training_classroom_from_view">
                <field name="name">教室</field>
                <field name="type">form</field>
                <field name="model">oecn.training.classroom</field>
                <field name="arch" type="xml">
                    <field name="number"/>
                    <field name="capacity"/>
                    <field name="location" />
                </field>
            </record>
            <!--定义列表视图-->
            <record model="ir.ui.view"
id="oecn_training_classroom_tree_view">
                <field name="name">教室列表</field>
                <field name="type">tree</field>
                <field name="model">oecn.training.classroom</field>
                <field name="arch" type="xml">
                    <field name="number"/>
                    <field name="capacity"/>
                    <field name="location" />
                </field>
            </record>

```

```

        <!--定义视图动作-->
        <record
model="ir.actions.act_window" id="action_oecn_training_classroom">
    <field name="name">教室</field>
    <field name="res_model">oecn.training.classroom</field>
    <field name="view_type">form</field>
    <field name="view_mode">form,tree</field>
    <field name="view_id"
ref="oecn_training_classroom_tree_view"/>
    </record>
    <menuitem id="oecn_training_classroom_menu" name="OECN
Training Classroom"
        parent="oecn_training.oecn_training_menu"
action="action_oecn_training_classroom"/>
    </data>
</openerp>

```

\* 代码分析时有用点

```

    <!--仅在编辑时显示标签-->
    <label for="name" class="oe_edit_only"/>

    <!--多公司时显示公司名-->
    <field name="company_id" groups="base.group_multi_company"
widget="selection"/>

```

\* css 的运用

oe\_grey: 灰色

```

<p class="oe_grey">Select the places where this route can be selected</p>

```

## (05)odoo 数据库和业务操作

以一个例子开头

\* To-do 向导

# 配置文件

\_\_openerp\_\_.py:

```
{ 'name': 'To-do Tasks Management Assistant',
  'description': 'Mass edit your To-Do backlog.',
  'author': 'Daniel Reis',
  'depends': ['todo_user'],
  'data': ['todo_wizard_view.xml'], }
```

\_\_init\_\_.py:

```
from . import todo_wizard_model
```

# 模型 todo\_wizard\_model.py

# -\*- coding: utf-8 -\*-

```
from openerp import models, fields, api
```

```
from openerp import exceptions # will be used in the code
```

```
import logging
```

```
_logger = logging.getLogger(__name__)
```

```
class TodoWizard(models.TransientModel):
```

```
    _name = 'todo.wizard'
```

```
    task_ids = fields.Many2many('todo.task', string='Tasks')
```

```
    new_deadline = fields.Date('Deadline to Set')
```

```
    new_user_id = fields.Many2one('res.users', string='Responsible to Set')
```

```
@api.multi
```

```
def do_mass_update(self):
```

```
    self.ensure_one()
```

```
    if not (self.new_deadline or self.new_user_id):
```

```
        raise exceptions.ValidationError('No data to update!')
```

```
    # else:
```

```
    _logger.debug('Mass update on Todo Tasks %s', self.task_ids.ids)
```

```
    if self.new_deadline:
```

```
        self.task_ids.write({'date_deadline': self.new_deadline})
```

```

if self.new_user_id:
    self.task_ids.write({'user_id': self.new_user_id.id})
return True

```

@说明几点:

@ 引入了日志功能，记录的级别如下 4 级

```

_logger.debug('A DEBUG message')
_logger.info('An INFO message')
_logger.warning('A WARNING message')
_logger.error('An ERROR message')

```

# 表单 todo\_wizard\_view.xml

```

<openerp>
<data>
  <record id="To-do Task Wizard" model="ir.ui.view">
    <field name="name">To-do Task Wizard</field>
    <field name="model">todo.wizard</field>
    <field name="arch" type="xml">
      <form>
        <div class="oe_right">
          <button type="object" name="do_count_tasks"
            string="Count"/>
          <button type="object" name="do_populate_tasks"
            string="Get All"/>
        </div>
        <field name="task_ids"/>
        <group>
          <group>
            <field name="new_user_id"/>
          </group>
          <group>
            <field name="new_deadline"/>
          </group>
        </group>
        <footer>
          <button type="object" name="do_mass_update"
            string="Mass Update" class="oe_highlight"
            attrs="{ 'invisible': [ ('new_deadline', '=', False), ('new_us
er_id', '=', False)] }"/>
          <button special="cancel" string="Cancel"/>
        </footer>
      </form>
    </field>
  </record>
</data>
</openerp>

```

```

        </form>
    </field>
</record>
<!-- More button Action -->
<act_window id="todo_app.action_todo_wizard"
            name="To-Do Tasks Wizard"
            src_model="todo.task" res_model="todo.wizard"
            view_mode="form" target="new" multi="True"/>
</data>
</openerp>

```

@说明：有一个批量更新的逻辑 do\_mass\_update

```

# 业务逻辑 todo_wizard_model.py
@api.multi
def do_mass_update(self):
    self.ensure_one()
    if not (self.new_deadline or self.new_user_id):
        raise exceptions.ValidationError('No data to update!')
    # else:
    _logger.debug('Mass update on Todo Tasks %s', self.task_ids.ids)
    if self.new_deadline:
        self.task_ids.write({'date_deadline': self.new_deadline})
    if self.new_user_id:
        self.task_ids.write({'user_id': self.new_user_id.id})
    return True

```

@说明：@api.one 这个是返回一个记录用的 这是主要用 task\_ids，所以这里不用  
 @api.multi 这是是返回一记录列表用  
 self.ensure\_one() 确保是单个，否则报异常

这里有异常处理：

```

from openerp import exceptions
raise exceptions.Warning('Warning message')
raise exceptions.ValidationError('Not valid message')

```

# 自动加载代码变化，这是主要 python 代码变化，就要手动重启服务，有点麻烦  
 从而有了 ./odoo.py -d v8dev --auto\_reload 自动加载  
 这个选项可以放到配置文件中 auto\_reload = True  
 有先安装一个依赖，才可以用 pip install pyinotify

# 向导窗口的动作

可以重新打开表单，从而一个表单上的多个按钮可以同时用

```
@api.multi
def do_reopen_form(self):
    self.ensure_one()
    return {
        'type': 'ir.actions.act_window',
        'res_model': self._name, # this model
        'res_id': self.id, # the current wizard record
        'view_type': 'form',
        'view_mode': 'form',
        'target': 'new'}
```

全选：

```
@api.multi
def do_populate_tasks(self):
    self.ensure_one()
    Task = self.env['todo.task']
    all_tasks = Task.search([])
    self.task_ids = all_tasks
    # reopen wizard form on same
```

\* 服务端的操作

# 开启命令行交互操作

<https://www.odoo.com/apps/modules/8.0/shell/>.

把那个 shell 模块，放到 addons 中去

```
$ ./odoo.py shell -d v8dev
```

指定账套，采用命令交互模式启动

这样就可以测试代码中用到的一些对象，如：

```
>>> self    得到当前用户对象，这里是超级用户对象
res.users(1,)
>>> self.name
u'Administrator'
>>> self._name
'res.users'
>>> self.env
<openerp.api.Environment object at 0xb3f4f52c>
```

# 用关系字段

```
>>> self.company_id
res.company(1,)
>>> self.company_id.name
u'YourCompany'
>>> self.company_id.currency_id
res.currency(1,)
>>> self.company_id.currency_id.name
u'EUR'
```

#### #模型中的查询

用 `self` 只能得到方法中的字段，但 `self.env` 可以得到任意其它模型  
`self.env['res.partner']` 得到合作伙伴对象  
 运用 `search()` 或 `browse()` 得到对象的记录

`search()` 里面是 `domain` 表达式，若为空[]则搜索所有的记录  
 模型中有 `active` 字段，默认为 `True` 搜索，还有一些参数如下：  
`order` 排序 `limit` 返回最大记录数 `offset` 记录数启点位置

`search_count()`得到记录总数

`browse()`主要根据记录 `id` 返回记录 多个，采用列表形式。单个时可以直接传入

例子：

```
>>> self.env['res.partner'].search([('name','like','a')])
res.partner(36, 5, 30, 31, 20, 27, 10, 24, 29, 22, 18)

>>> self.env['res.partner'].browse([5,30])
res.partner(5, 30)

>>> self.env['res.partner'].browse(5)
res.partner(5,)

>>> self.env['res.partner'].browse([5])
res.partner(5,)
```

#### #记录上的操作

```
>>> admin = self.env['res.users'].browse(1)
>>> admin.name='Superuser'
>>> admin.name
```

@创建一个新记录，但还没有持久化到数据库

```
>>> Partner = self.env['res.partner']
>>> new = Partner.create({'name':'ACME','is_compnay':True})
```

```
>>> print new
res.partner(37,)
```

@删除记录

```
>>> rec = Partner.search([('name','=', 'ACME')])
>>> rec.unlink()
True
```

@把 partner 对象全部 comment 的值改为 'Hello!'

```
res.partner(37,)
>>> Partner.write({'comment': 'Hello!'})
```

@复制一个记录

```
>>> demo = self.env.ref('base.user_demo') 得到 demo 这个用户对象
>>> new = demo.copy({'name': 'Daniel', 'login': 'dr', 'email': ''})
>>> self.env.cr.commit()
```

注：命令交互时操作记录不会记录到数据库中，只有用了 `self.env.cr.commit()` 后才  
会持久化到数据库中

#事务操作和原生 sql

```
self.env.cr 数据库操作句柄
self.env.cr.commit() 事务提交
self.env.savepoint() 事务提交点，回滚时可以来指定回滚到什么位置
self.env.rollback() 事务回滚
```

```
原生 sql 操作 self.env.cr.execute()
self.env.cr.execute("SELECT id, login FROM res_users WHERE login=%s
OR id=%s", ('demo', 1))
self.env.cr.fetchall()
```

#时间和日期

`%Y-%m-%d` 和 `%Y-%m-%d %H:%M:%S`

```
>>> from openerp import fields
>>> fields.Datetime.now()
'2016-01-25 07:12:34'
>>> fields.Datetime.from_string('2016-12-08 22:23:22')
datetime.datetime(2016, 12, 8, 22, 23, 22)
```

`fields.Date.today()` 得到当前的日期是服务器端的  
`fields.Datetime.now()`得到当前的时间是服务器端的  
`fields.Date.context_today(record,timestamp=None)` 从上下文得到当前的日期

`fields.Datetime.context_timestamp(record,timestamp)` 从上下文得到当前的时间

`from_string(value)` 字符串转换为日期或时间对象

`to_string(value)` 日期或时间对象转换为字符串

#### #关系字段操作

当采用活动记录模式时，用 `create()` 或 `write()` 赋关联字段时，不要用对象，要用外键 id

不要 `self.write({'user_id':self.env.user})`

而要改为 `self.write({'user_id':self.env.user.id})`

#### #操作记录集（集合操作）

`rs1 | rs2` 求并集 是指两个集合的所有元素构成的集合

`rs1 + rs2` 求两个集直接连起来，不管重复

`rs1 & rs2` 求交集 是指两个集合元素相同的部分构成的集合

`rs1 - rs2` 求差集 是指其中一个集合中除去另一个集合相同元素以后剩余的元素构成的集合

例子说明：

```
>>> Party=self.env['res.partner']
>>> Party.search([])
res.partner(36, 5, 7, 33, 32, 23, 30, 31, 19, 35, 20, 17, 21, 34, 27, 12, 8,
9, 15, 25, 14, 10, 24, 3, 1, 26, 29, 22, 6, 13, 11, 28, 16, 18)
>>> rs1=Party.browse([1,3,5,7])
>>> rs2=Party.browse([7,32,33])
>>> rs1 | rs2
res.partner(32, 1, 3, 5, 7, 33)
>>> rs1 + rs2
res.partner(1, 3, 5, 7, 7, 32, 33)
>>> rs1 & rs2
res.partner(7,)
>>> rs1 - rs2
res.partner(1, 3, 5)
```

记录切片(相当于序列切片操作)

```
>>> rs1
```

```

res.partner(1, 3, 5, 7)
>>> rs1[0]
res.partner(1,)
>>> rs1[-1]
res.partner(7,)
>>> rs1[1:]
res.partner(3, 5, 7)

```

记录集追求记录去除

```

self.task_ids |= task1    task1 在 task_ids 中没有就增加  <=>
self.write([(4, task1.id, False)])
self.task_ids -= task1    task1 在 task_ids 减去  <=> self.write([(3,
task1.id, False)])
self.task_ids = self.task_ids[:-1] task_ids 删除最后一个记录
<=> self.write([(3, self.task_ids[-1].id, False)])

```

其它记录集操作

record in recordset 检测一个记录是否在一个记录集中  
record not in recordset 检测一个记录是否不在一个记录集中

recordset.ids 记录 ID 集  
recordset.ensure\_one() 检测是一个记录  
recordset.exists() 若存在返回一个备份  
recordset.filtered(func) 过滤记录集  
recordset.mapped(func)  
recordset.sorted(func) 排序后

len(rs1) 得到记录数

```

>>> rs1
res.partner(1, 3, 5, 7)
>>> len(rs1)
4

```

```

rs1 = rs0.filtered(lambda r:r.name.startswith('H')) 通过 name 过滤
rs2 = rs0.filtered('is_company') 通过 is_compay 为 True 来过滤
rs2 = rs0.mapped('name') 得到只有 name 字段 组成记录集 列表
rs1.sorted(key=lambda r:r.id,reverse=True) 根据 id 反向排序

```

\* 执行环境

self.env 具有的属性:  
env.cr 数据库操作句柄

env.uid session 中的 user 的 id  
env.user session 中的 user 对象  
env.context session 中的上下文，以字典方式组成  
环境对象是不能改的只能换，重建  
env.sudo(user) 给了用户记录就返回该用户记录，没有，就返回超级用户  
env.with\_context(dictionary) 换了原有的 session  
env.with\_context(key=value,...) 换指定键的值

env.ref() 要一个 External ID 做为参数

```
>>> self.env.ref('base.user_root') 这是超级用户的 external ID
res.users(1,)
```

\* 客户端交互的模型方法

```
#
read([fields]) 像 search() 但返回来，每一行是一个字典类型
search_read([domain],[fields],offset,limit,order=None) 根据 read()后的
结果搜索
load([fields],[data]) 用于 ssv 数据导入
export_data([fields],raw_data=False) 用于 csv 数据导出

name_get() 得到(ID,name) 元组的列表 默认是计算 display_name
name_search(name="", args=None, operator='ilike', limit=100) 得到
(ID,name) 元组的列表 ,按条件
name_create(name) 创建一个新记录，只用 name 字段
default_get([fields]) 返回创建新记录时，指定字段的默认值
fields_get() 得到模型定义的哪些字段
fields_view_get() 得到指定视图类型下可用的字段， 视图类型，有 tree ,form,
等
```

#覆盖默认方法

create() 和 write() 这两个方法常扩展

例子如下：

```
@api.model
def create(self, vals):
    # Code before create
    # Can use the `vals` dict
    new_record = super(ToDoTask, self).create(vals)
    # Code after create
    # Can use the `new` record created
    return new_record
```

```

@api.multi
def write(self, vals):
    # Code before write
    # Can use `self`, with the old values
    super(TodoTask, self).write(vals)
    # Code after write
    # Can use `self`, with the new (updated) values
    return True

#模型方法修饰器
@api.one    一次得到一条记录

@api.multi 一次得到一个记录集

@api.model 这是类级别静态方法

@api.return(model)    显性返回一个模型

@api.depends(fld1,...)
@api.constrains(fld1,...)
@api.onchange(fld1,...)  可用于警告

#调试

import pdb; pdb.set_trace()

```

## (06)odoo 报表

### \* 创建业务报表

报表是通过 Qweb 的技术来建立的

#一般报表结构如下:

```
purchase
├─ views
│   ├── report_purchaseorder.xml (报表模板)
│   └── report_purchasequotaion.xml
└─ purchase_report.xml (模块中报表定义 模块名_report.xml)
```

当要建立报表时, 就按这样的结构来创建,

#注意, 报表, 用到了 wkhtmltopdf 依赖

<http://wkhtmltopdf.org/downloads.html> wkhtmltopdf-0.12.1 版本

```
$ sudo apt-get remove --purge wkhtmltopdf
```

```
$ cd /tmp
```

```
$
```

```
wget http://downloads.sourceforge.net/project/wkhtmltopdf/archive/0.12.1/wkhtmltox-0.12.1\_linux-trusty-amd64.deb
```

```
$ sudo dpkg -i wkhtmltox-0.12.1_linux-trusty-amd64.deb
```

#报表定义 purchase\_report.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<openerp>
  <data>
    <report
      string="Purchase Order"
      id="action_report_purchase_order"
      model="purchase.order"
      report_type="qweb-pdf"
      name="purchase.report_purchaseorder"
      file="purchase.report_purchaseorder"
    />

    <report
      string="Request for Quotation"
      id="report_purchase_quotation"
      model="purchase.order"
      report_type="qweb-pdf"
```

```

        name="purchase.report_purchasequotation"
        file="purchase.report_purchasequotation"
    />
</data>
</openerp>

```

@string: 在打印按钮那里的显示名称

@id: 外 id 标识

@name: 完整主模板名称 模块名.主模板名称 用于管理和调用

@file: 完整模板文件名 模块名.模板文件名 用于更好地关联模板

@model: 相关的模型显示在那个模块进行打印报表 通常在各视图中的打印那里会出现

上面表示在采购订单相关视图时，会出现“打印-询价单/采购订单”

@report\_type: 报表类型 是 qweb-pdf 或 qweb-html

@report\_name: 打印出来的文件名

@groups: 指定权限

<report> 是 ir.actions.report.xml 模型的快捷方式

```

<record id="action_report_purchase_order"
model="ir.actions.report.xml">
    <field name="name">Purchase Order</field>
    <field name="model">purchase.order</field>
    <field name="report_type">qweb-pdf</field>
    <field name="template_name">
        purchase.report_purchaseorder
    </field>
    <field name="paper_format_id" ref="report.paperformat_euro"/>
    #指定的纸张 可以到 addons/report/data/report_paperformat.xml 查

```

看可用纸张规格

```
</record>
```

报表可以在 设置->技术->报表 可以查到

t-call 调用的标准报告架构，这个很重要

report.external\_layout 包含头部和尾部，也可以只用  
report.internal\_layout 只用

基础架构的头部，其它部分自己写

# 报表模板 report\_purchaseorder.xml

# /addons/purchase/views/report\_purchase.xml:

```
<?xml version="1.0" encoding="utf-8"?>
```

```
<openerp>
```

```

<data>
<template id="report_purchaseorder_document">
  <t t-call="report.external_layout">
    <div class="page">
      <div class="oe_structure"/>
      <div class="row">
        <div class="col-xs-6">
          <strong>Shipping address:</strong>
          <div t-if="o.dest_address_id">
            <div t-field="o.dest_address_id"
              t-field-options='{ "widget": "contact", "fields":
["address", "name", "phone", "fax"], "no_marker": true}' />
            </div>
            <div t-if="not o.dest_address_id and o.picking_type_id
and o.picking_type_id.warehouse_id">
              <span
t-field="o.picking_type_id.warehouse_id.name"/>
              <div
t-field="o.picking_type_id.warehouse_id.partner_id"
              t-field-options='{ "widget": "contact", "fields":
["address", "phone", "fax"], "no_marker": true}' />
              </div>
            </div>
          <div class="col-xs-5 col-xs-offset-1">
            <div t-field="o.partner_id"
              t-field-options='{ "widget": "contact", "fields":
["address", "name", "phone", "fax"], "no_marker": true}' />
            <p t-if="o.partner_id.vat">VAT: <span
t-field="o.partner_id.vat"/></p>
            </div>
          </div>
          ...
        <div class="oe_structure"/>
      </div>
    </t>
  </template>

<template id="report_purchaseorder">
  <t t-call="report.html_container">
    <t t-foreach="doc_ids" t-as="doc_id">
      <t t-raw="translate_doc(doc_id, doc_model, 'partner_id.lang',

```

```

'purchase.report_purchaseorder_document')"/>
    </t>
</t>
</template>
</data>
</openerp>

```

@调用了 `report.external_layout` 模板 所在的布局文件在  
`/addons/report/views/layouts.xml`

@注意 `translate_doc` 中的 `purchase.report_purchaseorder_document` ,  
 这个要报表视图 id 前加模块名

这个名称和模板的 id 名称要一致

@模板名称 `report_purchaseorder_documen` 和模板名称  
`report_purchaseorder`

这样在报表定义时 `purchase.report_purchaseorder` 就可以关联到定义的模板

@ 大家可能注意到了 `o` 对于 `o` 是代表当前报表模型数据 在  
`/addons/report/models/report.xml`

`translate_doc` 这个方法

```

def translate_doc(self, cr, uid, doc_id, model, lang_field, template,
values, context=None):

```

```

    ctx = context.copy()

```

```

    doc = self.pool[model].browse(cr, uid, doc_id, context=ctx)

```

```

    qcontext = values.copy()

```

```

    # Do not force-translate if we chose to display the report in a
specific lang

```

```

    if ctx.get('translatable') is True:

```

```

        qcontext['o'] = doc

```

```

    else:

```

```

        # Reach the lang we want to translate the doc into

```

```

        ctx['lang'] = eval('doc.%s' % lang_field, {'doc': doc})

```

```

        qcontext['o'] = self.pool[model].browse(cr, uid, doc_id,

```

```

context=ctx)

```

```

    return self.pool['ir.ui.view'].render(cr, uid, template, qcontext,
context=ctx)

```

看到 `o` 就是报表中的 `doc`

#在报表中呈现数据

可用的变量:

`docs` 循环打印出一个记录集

`doc_ids` 一个记录集的 `ids` 列表打印出来

`doc_model` 调用哪个模型来处理

time 时间

user 本次执行报告的用户

res\_company 当前用户所在的公司

字段值用 `t-field` 属性 还可以用其补充属性 `t-field-options`  
上一道菜:

```
<h2 t-field="o.name"/>
  <p t-field="o.user_id.name"/>
  <ul>
    <t t-foreach="o.message_follower_ids" t-as="f">
      <li>
        
        <span t-field="f.name"/>
      </li>
    </t>
  </ul>
```

有货币字段:

```
<span t-field="o.amount"
      t-field-options='{
        "widget": "monetary",
        "display_currency": "o.pricelist_id.currency_id"}'/>

<div t-field="res_company.partner_id"
      t-field-options='{
        "widget": "contact",
        "fields": ["address", "name", "phone", "fax"],
        "no_marker": true}' />
```

支持语言翻译

```
<template id="report_todo_task_template">
  <t t-call="report.html_container">
    <t t-foreach="doc_ids" t-as="doc_id">
      <t t-raw="translate_doc(doc_id, doc_model,
                             'user_id.partner_id.lang',
                             'todo_kanban.report_todo_task_doc')"/>
    </t>
  </t>
</template>
translate_doc
```

注: col-xs-N N 代表多少列 像 bootstrap 写法, 一行划成 12 列

<t t-if="f\_last"> 循环到了最后

#纸张格式

```
<record id="report_todo_task_action"
model="ir.actions.report.xml">
  <field name="name">To-do Tasks</field>
  <field name="model">todo.task</field>
  <field name="report_type">qweb-html</field>
  <field name="template_name">
    todo_kanban.report_todo_task_template
  </field>
  <field name="paper_format_id" ref="report.paperformat_euro"/>
</record>
paper_format_id 引用了 report.paperformat_euro 这个格式, 这个值, 可
```

以在

设置->技术->报告->纸张格式

#模板加入模块中(\_\_openerp\_\_.py)

```
'data': [

'views/report_purchaseorder.xml',
'views/report_purchasequotation.xml',
],
```

## (07)odoo 扩展 API

\* 打开 XML-RPC 连接

```
>>> import xmlrpclib
>>> srv, db = 'http://localhost:8069', 'v8dev'
>>> user, pwd = 'admin', 'admin'
>>> common = xmlrpclib.ServerProxy('%s/xmlrpc/2/common' % srv)
>>> common.version()
{'server_version_info': [8, 0, 0, 'final', 0], 'server_serie':
'8.0', 'server_version': '8.0', 'protocol_version': 1}
```

依赖 xmlrpclib

#验证

```
>>> uid = common.authenticate(db, user, pwd, {})
>>> print uid
```

#取数据

```
>>> api = xmlrpclib.ServerProxy('%s/xmlrpc/2/object' % srv)
```

```
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'search_count', [[]])
得到记录集的总数
```

```
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'search',
[(['country_id', '=', 'be'), ('parent_id', '!=', False)])])
```

```
[43, 42]
```

得到记录集的 id 序列

```
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'read', [[43]],
{'fields': ['id', 'name', 'parent_id']})
```

```
[{'parent_id': [7, 'Agrolait'], 'id': 43, 'name': 'Michel
Fletcher'}]
```

得到记录

```
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'search_read',
[(['country_id', '=', 'be'), ('parent_id', '!=', False)]],
{'fields': ['id', 'name', 'parent_id']})
```

#其它方法

```
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'create', [{'name':  
    'Packt'}])  
75  
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'write', [[75],  
    {'name': 'Packt Pub'}])  
True  
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'read', [[75], ['id',  
    'name']])  
[{'id': 75, 'name': 'Packt Pub'}]  
>>> api.execute_kw(db, uid, pwd, 'res.partner', 'unlink', [[75]])  
True
```

\* 做一个桌面应用 用到接口

note\_api.py

-----

import xmlrpclib

class NoteAPI():

```
    def __init__(self, srv, db, user, pwd):  
        common = xmlrpclib.ServerProxy( '%s/xmlrpc/2/common' % srv)  
        self.api = xmlrpclib.ServerProxy('%s/xmlrpc/2/object' % srv)  
        self.uid = common.authenticate(db, user, pwd, {})  
        self.pwd = pwd  
        self.db = db  
        self.model = 'todo.task'
```

```
    def execute(self, method, arg_list, kwarg_dict=None):  
        return self.api.execute_kw(  
            self.db, self.uid, self.pwd, self.model,  
            method, arg_list, kwarg_dict or {})
```

```
    def get(self, ids=None):  
        domain = [('id', 'in', ids)] if ids else []  
        fields = ['id', 'name']  
        return self.execute('search_read', [domain, fields])
```

```
    def set(self, text, id=None):  
        if id:
```

```

        self.execute('write', [[id], {'name': text}])
    else:
        vals = {'name': text, 'user_id': self.uid}
        id = self.execute('create', [vals])
    return id

if __name__ == '__main__':
    srv, db = 'http://localhost:8069', 'v8dev'
    user, pwd = 'admin', 'admin'
    api = NoteAPI(srv, db, user, pwd)
    from pprint import pprint
    pprint(api.get())
-----
note_gui.py
-----

from Tkinter import Text, Tk
import tkMessageBox
from note_api import NoteAPI

class NoteText(Text):
    def __init__(self, api, text="", id=None):
        self.master = Tk()
        self.id = id
        self.api = api
        Text.__init__(self, self.master, bg='#f9f3a9',
            wrap='word', undo=True)
        self.bind('<Control-n>', self.create)
        self.bind('<Control-s>', self.save)
        if id:
            self.master.title('#%d' % id)
        self.delete('1.0', 'end')
        self.insert('1.0', text)
        self.master.geometry('220x235')
        self.pack(fill='both', expand=1)

    def create(self, event=None):
        NoteText(self.api, "")

    def save(self, event=None):
        text = self.get('1.0', 'end')
        self.id = self.api.set(text, self.id)
        tkMessageBox.showinfo('Info', 'Note %d Saved.' % self.id)

```

```

if __name__ == '__main__':
    srv, db = 'http://localhost:8069', 'v8dev'
    user, pwd = 'admin', 'admin'
    api = NoteAPI(srv, db, user, pwd)
    for note in api.get():
        x = NoteText(api, note['name'], note['id'])
    x.master.mainloop()
-----

```

#### \* ERPpeek

首先要安装 erppeek

```
$ pip install -U erppeek
```

#API 用法:

```

>>> import erppeek
>>> api = erppeek.Client('http://localhost:8069', 'v8dev',
    'admin', 'admin')
>>> api.common.version()
>>> api.count('res.partner', [])
>>> api.search('res.partner', [('country_id', '=', 'be'),
    ('parent_id', '!=', False)])
>>> api.read('res.partner', [43], ['id', 'name', 'parent_id'])

>>> m = api.model('res.partner')
>>> m = api.ResPartner

>>> m.count([('name', 'like', 'Packt%')]) 返回是数量
>>> m.search([('name', 'like', 'Packt%')]) 返回是 id
>>> recs = m.browse([('name', 'like', 'Packt%')]) 返回是记录对象

```

# CLI 用法

```
$ erppeek --help 可以看到详细的信息
```

\* 到这里插件开发就讲完了

## (08)odoo 继承机制

### \* 全局的引用

所有的模型定义外，都在注册中心注册了，我们可以用全局变量来引用这些模型  
`self.env[model name]` 比如得到合作伙伴这个模型 `self.env['res.partner']`

### \* 三种常用继承 (在 model 中操作)

`_inherit` 没重定义 `_name` 这样数据库不会新建对象表，用被继承的表

`_inherit` 重定义 `_name` 这样数据库会创建新的对象表存储

`_inherits` 是复合继承，有模型对象，有字段对象

示例：

```
class MyModelExtended(Model):
    _inherit = 'a.model'                # direct heritage
    _inherit = ['a.model', 'a.other.model']  # direct heritage
    _inherits = {'a.model': 'field_name'}    # polymorphic heritage
```

### \* 增加 field

```
from openerp import models, fields, api

class TodoTask(models.Model)
    _inherit = 'todo.task'

    user_id = fields.Many2one('res.users', string='Response')
    date_deadline = fields.Date('Deadline')
```

### \* 修改已有的 field

```
name = fields.Char(help="can I help you")
这样额外增加了 help 帮助信息
```

### \* 重载原模型的方法

`super(TodoTask, self)` 两个参数 一个是具体父类的类名和 `self`

```
@api.multi
def do_clear_done(self):
    domain = [('is_done', '=', True),
              '|', ('user_id', '=', 'self.env.uid'),
              ('user_id', '=', False)]
    done_recs = self.search(domain)
    done_recs.write({'active': False})
```

```
return True
```

```
@api.one
```

```
def do_toggle_done(self):  
    if self.user_id != self.env.user:  
        raise Exception('Only the responsible can do this!')  
    else:  
        return super(TodoTask, self).do_toggle_done()
```

要某该记录的 `user_id` 等于当前用户的 `id self.env.uid` , 要某 `user_id` 值为 `False`

`@api.multi` 告诉我们这个函数里面的 `self` 是一个 `recordset`

`@api.one` 自动遍历目标 `recordset`, 然后方法里面的 `self` 就是一个 `record`。

#### \* recordset 操作

```
record in recset1 # 包含  
record not in recset1 # 不包含  
recset1 + recset2 # 两个相加分前后顺序  
recset1 | recset2 # 两个并集  
recset1 & recset2 # 两个交集  
recset1 - recset2 # difference 两个差集  
recset.copy() # copy the recordset (not a deep copy) 浅拷贝
```

如:

```
for record in recordset:  
    print(record)
```

#### \* domain 语法

最基本的语句 `[('field_name','operator',value)]`

`field_name` 必须目标模型的有效 `field` 名字

`operator` 有 `=` `!=` `>` `>=` `<` `<=` `like` `ilike`

`not in`, `parent_left`, `child_of`, `parent_right`

`value` 必须和前面的 `field_name` 类型相同的某个值

基本的语句 可以用逻辑运算符连接, 默认的符号是 `&`

```
[('field_name1', 'operator', value), '!',  
 ('field_name2', 'operator', value), '|',  
 ('field_name3', 'operator', value), ('field_name4', 'operator', value)]
```

! 只作用于后面一个元素 , &和| 作用于后面两个元素

上面解析为:

1 表达式 and 2 表达式否 and 3 表达式 或 4 表达式

\* recordset 的 search 方法

返回得是一个 recordset

self.env[model\_name].search(domain 表达式)

\* 视图的继承

```
<?xml version="1.0"?>
<openerp>
  <data>
    <record id="view_form_todo_task_inherited" model="ir.ui.view">
      <field name="name">Todo Task form – User extension</field>
      <field name="model">todo.task</field>
      <field name="inherit_id" ref="todo_app.view_form_todo_task"/>
      <field name="arch" type="xml">
        <field name="name" position="after">
          <field name="user_id" />
        </field>
        <field name="is_done" position="before">
          <field name="date_deadline" />
        </field>
        <field name="name" position="attributes">
          <attribute name="string">I have to...</attribute>
        </field>
      </field>
    </record>
  </data>
</openerp>
```

<field name="inherit\_id" ref="todo\_app.view\_form\_todo\_task"/> 定义继承

定位 path 语法 //field[@name]="

```
<field name="name" position="after">
  <field name="user_id" />
</field>
```

插入点有 inside 插入到定位标签之内

before 插入到定位标签之前

after 插入到定位标签之后

replace 替换定位标签，若是空内容，就是删除原标签元素

原视图属性更改

```
<field name="name" position="attributes">
  <attribute name="string">I am going to</attribute>
</field>
```

```
<field name="active" position="attributes">
  <attribute name="invisible">1</attribute>
</field>
```

隐藏标签，这个常用，不建议前面说的删除标签

#### \* 多态继承

`_inherit` 可以继承多个模型

```
_name='todo.task'
_inherit = ['todo.task','mail.thread']
```

#### \* 修改其它数据文件

不能像视图文件下的 `arch` 结构下的 `xml` 可以用 `XPath` 表达式

# 删除记录

```
<delete model="ir.rule" search="[(('id', '=',
  ref('todo_app.todo_task_user_rule')))]" />
```

# 更新数据

```
<record id="x" model="y">
  <record id="todo_task_per_user_rule" model="ir.rule">
    <field name="name">ToDo Tasks only for owner</field>
    <field name="model_id" ref="model_todo_task"/>
    <field name="groups" eval="[(4, ref('base.group_user')))]"/>
    <field name="domain_force">
      ['|',('user_id','in',[user.id,False]),
        ('message_follower_ids','in',[user.partner_id.id])]
    </field>
  </record>
```

## (09)odoo workflow

### \* workflow

查到相对应的工作流 设置->工作流->工作流

对应的模型 **workflow** 对应的表格 是 **wkf** 开头的表

一个 workflow 模型在 **Session** 模型上都加入了 **state** 字段；有三种字段， **Draft**  
**Confirmed** **Done**

有效的转变有：

**Draft ->Confirmed** **Confirmed -> Draft** **Confirmed -> Done** **Done -> Draft**

workflow 中的节点叫“活动(activity)” 弧线连接叫“转变(transition)”

转变可以增加属性如 条件、信号、触发器

workflow 功效：

- # 关于记录如何演变的描述
- # 根据多样的弹性的条件建立自动化行动机制
- # 管理公司流程和确认规则
- # 管理对象间的互动
- # 在他们的生命期内一个可视化的流程图

#定义 workflow 对象：

```
<record id="wkf_qingjia" model="workflow" >
  <field name="name">wkf.qingjia</field>
  <field name="osv">qingjia.qingjd</field>
  <field name="on_create">True</field>
</record>
```

**model**: 固定取值"workflow"

**id**: 任意值，唯一标识本 workflow

**name** 本 workflow 的名称，随意

**osv** 这个很重要，对应的具体的那个模型

**on\_create** 一般设置为 **True**， workflow 会根据每一个模型新建一个对象再实例化一次

workflow 和 workflow 实例： workflow 定义了对某一类型的对象，如采购订单（PO）的处理流程。

例如， PO 单的一般处理流程也许是：

- 1) 新建 PO, **State = draft**;
- 2) 审批 PO, 审批的同时,
  - a) 系统自动产生收货单，工仓库收货；
  - b) 系统自动产生凭据（Invoice），供财务确认付款；

c)系统自动产生 PDF 的采购订单，并自动 EMail 给该 PO 单对应的供应商。

但对于特定的某个 PO 对象，需要一个 workflow 实例，以记录本 PO 对象处在流程的哪个阶段，

如 PO1 尚在 draft 状态，PO2 已经审批通过。PO 单的审批，以及对应的 a)、b)、c) 的动作，

都可以在 OE 的工作流中定义解决，而不需要全编码在 PO 对象上。

即 workflow 实现了流程处理相关的代码和被处理对象的代码相分离，降低了不同处理代码的耦合性，

增加了系统功能的柔软性。

#创建活动(Activity):

```
<record model="workflow.activity" id="activity_id">
  <field name="wkt_id" ref="workflow_id"/>
  <field name="name">activity.name</field>
  <field name="kind">dummy | function | subflow | stopall</field>
  <field name="subflow_id">subflow_id</field>
  <field name="action">(...)</field>
  <field name="action_id">(...)</field>
  <field name="split_mode">XOR | OR | AND</field>
  <field name="join_mode">XOR | AND</field>
  <field name="signal_send">(...)</field>
  <field name="flow_start">True | False</field>
  <field name="flow_stop">True | False</field>
</record>
```

model: 固定取值 workflow.activity

flow\_start 如果设置为 True 工作流会从这里开始

wkt\_id 属于某个 workflow 对象我们看到这里的 ref 语法如果是引用本模型内的对象则可以省略

kind 有四种 dummy function subflow stop all

Dummy 表示不执行任何动作，即 action 中定义的代码不会被执行。

Function 表示执行 action 中定义的 python 代码，且执行 action\_id 中定义的 server action。

常见情况是，action 中定义一个 write 方法，修改流程关联的对象的状态。对于 Function 类型的节点，

action 中定义的代码或者返回 False，或者返回一个客户端动作 id (A client action should be returned)。

Subflow 类型表示触发“subflow\_id”中指定的工作流。仔细的读者或许要问，工作流的执行总是和某个被处理的对象关联，是的，

如果定义了 action，subflow 关联的对象 id 由 action 中定义的代码返回。如果没有定义 action，

系统默认 **subflow** 关联的对象和本节点所属的工作流处理的对象 **id** 一致。

**stopall** 类型表示，流程到此节点则结束，但结束前，系统仍会执行 **action** 中的代码。

**signal\_send**: 执行完本节点的动作 (**action** 及 **action\_id** 定义的动作) 后，应向别的工作流发往的 **signal**，格式是: **subflow.signal**。**subflow\_id** 和 **signal\_send** 必须配合使用，

**subflow\_id** 表示，触发子工作流 **subflow\_id**，在该子工作流中，通常必须定义 **signal\_send**，

**signal\_send** 定义父流程中的某个 **signal**，表示，子流程处理结束后触发父流程中的信号 **subflow.signal**。注意，用于父子流程通信的工作流 **signal** 必须是形如 **subflow.\***。

例如，在 HR 模块的 workflow "wkf\_expenses" 中，需要开发票时候，它触发流程 **account** 模块中的工作流 "account.wkf" (<field name="subflow\_id" ref="account.wkf"/>)。

**account.wkf** 处理完成后，发出信号 **subflow.paid** 通知 **wkf\_expenses** 流程 (<field name="signal\_send">subflow.paid</field>)。

**wkf\_expenses** 中定义了信号 **subflow.paid** (<field name="signal">subflow.paid</field>)。

**split\_mode**: 有三个选项，**XOR**，**OR**，**AND**，默认是 **XOR**。**XOR** 表示，由本节点始发的出迁移中，沿着第一个满足迁移条件的迁移跳转。**OR** 表示由本节点始发的出迁移中，

只要满足迁移条件即沿该迁移跳转。**AND** 表示由本节点始发的出迁移中，只有所有迁移皆满足迁移条件才跳转，而且是同时沿所有迁移跳转。**XOR** 只有一个跳转，

**OR** 有零或多个跳转，**AND** 有零或全部跳转。

**join\_mode**: 有两个选项，**XOR**，**AND**，默认是 **XOR**。**XOR** 表示，以本节点为终点的入迁移中，只要有一个跳至本节点，即执行本节点的 **action**。**AND** 表示，以本节点为终点的入迁移中，

只有所有迁移都已经跳至本节点，才执行本节点的 **action**。

**action** 具体的动作 (于模型上)

**flow\_start**: 表示流程的开始节点。

**flow\_stop** 一个工作流的完成就是所有的活动有 **flow\_stop** 属性的都设置为了 **True**

#创建迁移(Transition):

```
<record model="workflow.transition" id="holiday_draft2confirm"><!-- 1.
draft->submitted (confirm signal) -->
  <field name="act_from" ref="act_draft" />
  <field name="act_to" ref="act_confirm" />
  <field name="signal">confirm</field>
  <field name="condition">can_reset</field>
  <field name="group_id" ref="base.group_user"/>
</record>
```

转变对象属于 **workflow.transition** 模型。

**act\_from**: 本迁移的起始节点，引用之前定义的 **Activity**。

**act\_to:** 本迁移的结束节点，引用之前定义的 **Activity**。

**signal:** 触发本迁移的信号，表示，如果系统收到 **signal** 定义的信号，则触发本迁移。  
触发信号有三种方式，

1) 最常见的是用户点击视图中的“**name = 本处定义的 signal**”的 **button**，此时相当于向系统发送迁移信号量。

系统会根据视图中的对象 **id**，找到对象关联的 **workflow**，再找到与 **button name** 相同的 **signal**，触发之。

2) 调用 **workflow\_service** 的方法: **trg\_validate(self, uid, res\_type, res\_id, signal, cr)**，此方法表示，

触发对象类型 **res\_type** 关联的 **workflow** 的 **signal** 信号，工作流实例关联的对象实例是 **res\_id**。

3) 子流程的 **signal\_send** 发出的信号，此种情况前文已说过。

**condition:** 迁移的条件，是一段 **Python** 代码，通常是一个函数调用。当系统收到 **signal** 中定义的信号时候，检查此处的条件，条件为真则实际触发迁移。

**trigger\_model** 和 **trigger\_expr\_id**: 此二字段表示启动一个新工作流实例。  
**trigger\_model** 定义对象类型，**trigger\_expr\_id** 定义一段 **Python** 代码，

返回 **trigger\_model** 类型的对象 **id**。此二字段表示，如果 **act\_from** 中的 **action** 执行完毕，且 **condition** 条件 **OK**，则系统中插入一个 **trigger\_model** 类型，

**trigger\_expr\_id** 返回的对象 **id** 关联的工作流实例。然后，可以调用 **workflow\_service** 的方法 **trg\_trigger(self, uid, res\_type, res\_id, cr)** 实际执行该工作流。

实际使用例子请参考 **Sale** 模块的工作流定义 **wkf\_sale**:

```
<field name="trigger_model">procurement.order</field>
<field name="trigger_expr_id">procurement_lines_get()</field>
group_id 权限组 如 <field name="group_id" ref="groupid" />
```

-----  
查询某个工作流的 **activity** 和 **transition**

```
select
a.name,a.osv,a.on_create,
d.id,d.condition,d.group_id,d.signal,
b.id as from_act_id,b.name as
from_action,b.split_mode,b.join_mode,b.kind,
c.id as to_act_id,c.name as to_action,c.split_mode,c.join_mode,c.kind
from wkf a
join wkf_activity b on a.id = b.wkf_id
join wkf_activity c on a.id = c.wkf_id
join wkf_transition d on b.id = d.act_from and c.id = d.act_to
where a.osv = 'sale.order'
and b.name in('sent','router','wait_invoice','wait_ship','ship')
order by b.name
--查询某个对象的工作流实例的 workitem
select a.inst_id,a.act_id,c.name as act_name,a.state,
```

```

c.split_mode,c.join_mode,c.kind
from wkf_workitem a
join wkf_instance b on a.inst_id = b.id
join wkf_activity c on a.act_id = c.id
where b.res_type = 'sale.order'
and b.res_id = 53
-查询某个对象的工作流实例的 log
select a.* ,b.name as act_name
from wkf_logs a
join wkf_activity b on a.act_id = b.id
where res_id = 53 and res_type = 'sale.order'
-----

```

来一个完整的工作流文件

```

<?xml version="1.0" ?>
<openerp>
  <data noupdate="0">
    <record id="wkf_qingjia" model="workflow" >
      <field name="name">wkf.qingjia</field>

## (10)odoo 控制器操作

\* 一个简单的控制器

```
class Mymodule(http.Controller)
    @http.route('mymodule/mymodule/', auth='public')
    def index(self,**kw)
        return "Hello, world"
        #return
http.request.render("mymodule.index",{ 'fruits':['apple','banana','pear']})
    使用模板
```

对应的模板文件

```
<openerp>
    <data>
        <template id="index">
            <title>mymodule</title>
            <t t-foreach="fruits" t-as="fruit">
                <p><t t-esc="fruit"></p>
            </t>
        </template>
    </data>
</openerp>
```

\* 路由 (URL Patterns)

# 带参数

```
@http.route('hello/<name>')
def hello(self,name, **kw){
    return "Hello,{ }".format(name)
}
```

#指定参数是整数

```
@http.route('hello/<int:identifier>')
def hello(self,identifier, **kw){
    return "Hello,{ }".format(identifier)
}
```

#指定参数是长度为 5 的字符串

```
@http.route('hello/<string(length=5):lang>')
def hello(self,lang, **kw){
    return "Hello,{ }".format(lang)
}
```

```
}
```

```
#指定参数是指定字符串数组之一
```

```
@http.route('hello/<any(bird,reptil,mammal):group>/<int:id>/')
```

```
def hello(self,group,,id, **kw){  
    return "Hello,{ }".format(group,id)  
}
```

```
* string(minlength=1,maxlength=None,length=None)
```

```
* path
```

```
* any(*items)
```

```
* int([fixed_digits][,min][,max])
```

```
* float([min],[,max])
```

```
* uuid(Werkzeug0.10)
```

```
* model(model_name)
```

```
#多重路径匹配
```

```
@http.route(['/hello/', '/hello/<int:value>'])
```

```
def hello(self,value, **kw){  
    return "Hello,{ }".format(value)  
}
```

```
#网站支持
```

```
@http.route('/hello/', website=True)
```

```
def hello(self, **kw):  
    return http.request.render('module.hello')
```

```
-----
```

```
http.request.website
```

```
http.request.lang 得到语言
```

```
http.request.redirect(url) 跳转
```

```
* 验证
```

```
#公用，不要验证可以访问
```

```
@http.route('/hello/', 'public')
```

```
def hello(self, **kw){  
    # code
```

```
}
```

```
#要登录才能访问，否则跳到登录页面
```

```
@http.route('/hello/', 'user')
```

```
def hello(self, **kw){  
    # code
```

```

}

#request.uid=None
@http.route('/hello/', 'none')
def hello(self, **kw):
    # code
}

# 采用 GET 模式访问
@http.route('/hello/', methods=['GET'])
def hello(self, **kw):
    # code
}

# 采用 POST 模式访问
@http.route('/hello/', methods=['POST'])
def hello(self, **kw):
    # code
}

```

\* 请求

```

class openerp.http.WebRequest(httprequest)
    封装的属性
        httprequest: werkzeug.wrappers.Request 原始的 request
        params: 映射的参数
        env: 当前环境
        context: 上下文
        session: 会话
        cr: 数据库操作句柄
        debug: 当前是否调试模式
        db: 当前连接的数据库

class openerp.http.HttpRequest(*args)
    make_response(data, headers=None, cookies=None)
    not_found(description=None) 404 页面的响应
    render(template, qcontext=None, lazy=True, **kw) 带上模板渲染

class openerp.http.JsonRequest(*args)
    返回 json

```

\* 响应

```
class openerp.http.Response(*args, **kw)
    *args 为
        template (basestring) -- 指定的模板名
        qcontext (dict) -- 渲染的上下文
        uid (int) -- 渲染到模板上的用户 id
```

可用的方法

```
render() 渲染指定模板
flatten() 强制渲染，没有采用模板
```

\* 控制器

```
class openerp.http.Controller
```

```
class MyController(openerp.http.Controller):
    @route('/some_url', auth='public')
    def handler(self):
        return stuff()
```

覆盖:

```
class Extension(MyController):
    @route()
    def handler(self):
        do_before()
        return super(Extension, self).handler()
```

## (11)odoo 权限机制

### \*权限管理的四个层次

# 菜单级别：不属于指定菜单所包含组的用户看不到该菜单，不客全，只是隐藏菜单，若知道菜单 ID，仍然可以通过指定 URL 访问

# 对象级别：对某个对象是否有'创建，读取，修改，删除'的权限，可以简单理解为表对象

# 记录级别：对对象表中的数据的访问权限，比如访问“客户”对象，业务员只能对自己创建

的客户有访问权限，而经理可以访问其管辖的业务员所有的“客户”对象

# 字段级别：一个对象或表上的某些字段的访问权限，比如产品的成本字段只有经理有读权限

```
'name':fields.char('Name',size=128,required=True,select=True,write=['base.group_admin']
```

```
read=['base.group_admin'])
```

定义 name 字段只能超级用户组可读写

### \* 权限组

权限管理核心是权限组，每个权限组，可以设置权限组的 Menus,Access Right, Record Rule

#### # Menus:

定义该权限组可以访问哪些菜单，若该权限组可以访问某父菜单，父菜单对应的子菜单会显示出来

若不想显示其子菜单，可以把其子菜单加入 "Useablity/No One" 权限组。

#### # Access Right:

定义该权限组可以访问哪些对象，以及拥有 增、查、改、删的哪个权限 (create,read,write,unlink)

#### # Record Rule:

定义该权限组可以访问对象中的哪些记录，以及拥有 增、查、改、删的哪个权限，Access Right 是

对对象中的所有记录赋权限，Record Rule 则通过定义 domain 过滤指定某些记录赋权限

```
['&','department','=',user.context_department_id.id),('state','=','pr_draft')]
```

申购单的部门等于当前用户的部门，且申购单的状态是草稿状态

### \* 基于组的访问控制

#### # 视图中

运用 group\_id

```
<record id="view_order_form_editable_list" model="ir.ui.view">
```

```
<field name="name">sale.order.form.editable.list</field>
```

```

<field name="model">sale.order</field>
<field name="inherit_id" ref="sale.view_order_form" />
<field name="group_id" eval="[(6,0,[ref('product.group.uos'),
    ref('product.group_stock_packaging'),
    ref('sale.group_mrp_properties')])]" />
<field name="arch" type="xml">
    <xpath expr="//field[@name='order_line']/tree" position="before"
        <attribute name="editable" />
    </xpath>
</field>
</record>

```

eval:把 eval 的值通过作为 python 运算返回该属性

ref:视图的方法，根据 module\_name.xml\_id 返回数据库 id

[(6,0,[xx,yy])]

(0,\_,{'field': value}) 这将创建一个新的记录并连接它

(1,id,{'field': value}): 这是更新一个已经连接了的记录的值

(2,id,\_) 这是删除或取消连接某个已经连接了的记录

(3,id,\_) 这是取消连接但不删除一个已经连接了的记录

(4,id,\_) 连接一个已经存在的记录

(5,\_,\_) 取消连接但不删除所有已经连接了的记录

(6,\_,[ids]) 用给出的列表替换掉已经连接了的记录

这里的下划线一般是 0 或 False

\*访问权限管理:

对于其内的数据访问权限管理有两种机制:

第一种是模型访问权限管理 (accessrule);

第二种是记录规则管理 (record rule)。

record rule 是对 accessrule 的细化

如果不为模块设置规则，默认只有 Administrator 才能访问这个模型的数据

record rule 对 Administrator 用户是无效的，而 access rule 还是有效

# access rule

权限对象模型是 ir.model.access.csv

一般是放在 security 文件夹下的 ir.model.access.csv 文件来管理的

文件表头如下:

```

id,name,model_id:id,group_id:id,perm_read,perm_write,perm_create,perm
_unlink

```

来一个例子:

```

id,name,model_id:id,group_id:id,perm_read,perm_write,perm_create,perm
_unlink

```

```

access_todo_task_group_user,todo.task.user,model_todo_task,base.group

```

\_user,1,1,1,1

id:权限的 ID 不可重复

name 描述

model\_id:id: 对象, 命名是 model\_xxx

group\_id:id 组名称

下面的, 0 表示无权限, 1 表示有权限

perm\_read 只读

perm\_write 修改

perm\_create 创建

perm\_unlink 删除

# record rule

一般是放在 security 文件夹下的 模块名\_record\_rules.xml 文件来管理的

```
<?xml version="1.0" encoding="utf-8"?>
<openerp>
  <data noupdate="1">
    <record id="todo_task_user_rule" model="ir.rule">
      <field name="name">ToDo Tasks only for owner</field>
      <field name="model_id" ref="model_todo_task"/>
      <field name="domain_force">[(('create_uid','=',user.id))</field>
      <field name="groups" eval="[(4,ref('base.group_user'))]" />
      <field name="perm_read" eval="1" />
      <field name="perm_write" eval="1" />
      <field name="perm_create" eval="1" />
      <field name="perm_unlink" eval="1" />
    </record>
  </data>
</openerp>
```

record rule 记录是 ir.rule 模型, 存在 public.ir\_rule 表格中

model\_id 作用于哪个模型

domain\_force 对该模型中所有记录进行某种过滤操作

noupdate 值为 1 表示升级模块不会更新本数据

base.group\_user 是人力资源 / 雇员

\* 来一个完整的例子解说:

# 建立组

```
<record id="group_department_project_admin" model="res.groups">
  <field name="name">A</field>
```

```
<fieldname="category_id" ref="B"/>
<field name="users" eval="[(4, ref('base.user_root'))]" /> //把 admin 用户加入该组中
```

```
</record>
```

@ name 组名称

@ category\_id 属于哪个应用程序，或者哪个模块

@ users 组里面的用户

这样 B 应用程序就建立了一个名叫 A 的组。并且初始化了 A 组的一个用户 admin

# 组控制菜单显示

A

```
<record model="ir.ui.menu" id="menu_id1">
  <field name="name">menu1</field>
  <field name="groups_id" eval="[(6,0,[ref('A'),ref('B')]),]" />
  <field name="sequence">1</field>
</record>
```

@ name 菜单名称

@ groups\_id 哪些组可以访问该菜单

@ sequence 该菜单的序号

这样 A 组与 B 组的成员都可以访问 menu1 菜单，menu1 菜单的显示顺序为 1

注：eval 后面解释，多个组访问用“，”隔开

```
<menuitem id="menu_id2 " name="menu2" parent="menu_id1"
sequence="1" groups="A,B " />
```

@ name 菜单名称

@ parent 父类菜单 如果没有可以不写 parent

@ groups 哪些组可以访问该菜单

这样 menu1 的子菜单 menu2 可以被 A 组合 B 组的成员访问

# 权限规则

```
<record model="ir.rule" id="rule1">
  <field name="name">rule1</field>
  <field name="model_id" ref="model_model1"/>
  <field name="global" eval="True"/>
  <field name="domain_force">[1,'=',1]</field>
  <field name="groups" eval="[(4,ref('A'))]" />
</record>
```

@ name 规则名称

@ model\_id 依赖的模块

@ global 是否是全局

@ domain\_force 过滤条件

@ groups 属于哪个组

这样 A 组的成员就可以取到 model\_model1 的所有数据

```
# ir.model.access.csv
```

@id 随便取

@name 随便取

@model\_id:id 这个就是你所定义的对象了

@group\_id:哪个组

@perm\_read,"perm\_write","perm\_create","perm\_unlink" 增删改查权限了。

1 代表有权限

```
# Eval
```

many2many

(0,0,{values}) 根据 values 里面的信息新建一个记录。

(1,ID,{values})更新 id=ID 的记录（写入 values 里面的数据）

(2,ID) 删除 id=ID 的数据（调用 unlink 方法，删除数据以及整个主从数据链接关系）

(3,ID) 切断主从数据的链接关系但是不删除这个数据

(4,ID) 为 id=ID 的数据添加主从链接关系。

(5) 删除所有的从数据的链接关系就是向所有的从数据调用(3,ID)

(6,0,[IDs]) 用 IDs 里面的记录替换原来的记录（就是先执行(5)再执行循环 IDs 执行(4,ID)）

例子[(6, 0, [8, 5, 6, 4])] 设置 many2many to ids [8, 5, 6, 4]

one2many

(0, 0,{ values })根据 values 里面的信息新建一个记录。

(1,ID,{values}) 更新 id=ID 的记录（对 id=ID 的执行 write 写入 values 里面的数据）

(2,ID) 删除 id=ID 的数据（调用 unlink 方法，删除数据以及整个主从数据链接关系）

例子：

[(0,0,{ 'field\_name':field\_value\_record1,...}), (0,0,{ 'field\_name':field\_value\_record})]

many2one 的字段比较简单，直接填入已经存在的数据的 id 或者填入 False 删除原来的记录。

```
# 隐藏的常用技巧
```

\* 直接隐藏

```
<group name="owner" position="attributes">
```

```

        <attribute name="invisible">True</attribute>
    </group>

* 满足某些条件的隐藏

    <xpath expr="//field[@name='parent_id']" position='attributes'>
        <attribute name="attrs">{'invisible': [('passenger','=',
True)]}</attribute>
    </xpath>

    <group col="4" string='旅客信息' attrs="{ 'invisible': [('supplier','=',
True)]}"></group>

* 通过组来隐藏

    <xpath expr="//field[@name='type']" position="attributes">
        <attribute name="groups">base.group_no_one</attribute>
    </xpath>

* 菜单的隐藏

    <record model="ir.ui.menu" id="crm.menu_crm_opportunities">
        <field eval="[(6,0, [ref('base.group_no_one'),])]"
name="groups_id"/>
    </record>

```

## (12)odoo 各种提前期和时间

### 1) Product 的提前期

**Customer Lead Time (sale\_delay)**：客户提前期，指 SO 确认到向客户发货的天数，由于销售数量不同该时间也不同，因此，这里是一个平均时间。

**Manufacturing Lead Time (produce\_delay)**：生产提前期，指该产品从生产下单到生产完工的天数，由于生产数量不同，该时间也不同，因此，这里是一个平均时间。这个时间必须包含其子部件的 **produce\_delay**，以及其零部件的采购提前期。OpenERP 没有提供根据其 BoM 表及各零件的采购提前期自动计算这个时间的功能。这个时间必须预先计算好，而后恰当设置。

**Delivery Lead Time(seller\_delay)**：指该产品采购下单到采购收货的天数，因为不同供应商，这个时间不同，因此这个时间是针对供应商而设的。又由于采购数量不同，这个时间也不同，因此这个时间是采购数量的一个平均时间。

### 2) Company 的提前期

**Scheduler Range Days(schedule\_range)**：MRP 运算的时间范围（天数），MRP 运算时候，只计算 **Scheduled date** 在 **today + schedule\_range** 之前的 **Procurement**。

**Purchase Lead Time (po\_lead)**：全体采购提前期，该公司的所有产品的采购都加上这个天数。

**Manufacturing Lead Time (manufacturing\_lead)**：生产提前期，该公司的所有产品生产都加上该天数。

**Security Days (security\_lead)**：销售提前期，该公司的所有产品的销售都加上该天数。

### 3) SO 的时间

**Confirmation Date**：SO 确认时间

**Creation Date**：SO 创建时间

**Delivery Lead Time (delay)**：这个在每个 SO Line 上设置，指该产品行从 SO 确认到向客户发货需要的天数，默认值是产品的 **sale\_delay** 加上公司的 **security\_lead**。

### 4) Procurement Order 的时间

**Scheduled date(date\_planned)**：产品行预计供应时间。也即产品行预计的收货、发货时间。

如果是 SO 确认而产生的 **Procurement**，该时间是：SO 确认日期 + SO Line 上的 **delay**。

### 5) PO 时间

**Expected Date (minimum\_planned\_date)**：预计的采购下单时间，默认值是各 PO Line 上的 **date\_planned** 的最小值，如果修改该值，系统自动修改 PO Line 上的 **date\_planned**，使得所有 **date\_planned** 时间不早于该值。

**Date Ordered(date\_order)**：SO 创建时间。

**Date Approved (date\_approved)**：SO 确认时间。

**Scheduled Date (date\_planned)**：这个在每个 PO Line 上设置，预计的采购下单

时间。默认值是 `procurement.date_planned - company.po_lead - seller_delay`。  
即产品行预计供应时间 - 公司采购提前天数 - 该产品的该供应商的采购提前天数。

#### 6) Picking 时间（收、发货单时间）

**Expected Date (min\_date)**：预计的收货、发货时间，该值是 Picking Line 上的 `date_expected` 的最小值。

**Order Date (date)**：Picking 创建时间。

**Date (date)**：这个在 Picking Line (`stock.move`) 上设置,指本产品行实际收货、发货（库存移动）时间，初始默认值是 `date_expected`。

**Scheduled Date (date\_expected)**：在 Picking Line (`stock.move`) 上设置,预计的本产品行收货、发货（库存移动）时间。默认值是 `Procurement.date_planned`。

#### 7) Manufacture Order 时间

**Scheduled date (date\_planned)**：预计的生产开工时间。默认值是 `Procurement.date_planned - Product.produce_delay - Company.manufacturing_lead`。如果是 MTO 产品，默认值是 SO 确认时间+SO Line 上的 `delay` - 产品的生产提前期 - 公司的生产提前期。如果是零部件的 MO，其值是它的父亲的 `MO.date_planned` - 产品的生产提前期 - 公司的生产提前期。

**Start Date (date\_start)**：实际的生产开工时间。

**End Date (date\_end)**：实际的生产完工时间。

## (13)odoo 翻译

### \* 翻译概述:

每个模块都可以提供自己的翻译文件，存放在 i18n(其来源是英文单词 internationalization 的首末字符 i 和 n，

18 为中间的字符数)目录下,文件名为 LANG.po LANG 为语言,如中文简体 zh\_CN.po

```
| - stock # 模块
|   | - i18n # 翻译目录
|   |   | - stock.pot # 翻译模板
|   |   | - zh_CN.po # 中文简体
|   |   | - (..).po # 其它语言翻译文件
```

### \* 翻译方法

@代码片段中的翻译

```
#. module: stock
#: code:addons/stock/stock.py:1677
#, python-format
msgid " (%s reserved)"
msgstr " (%s 被保留) "
-----
addons/stock/stock.py
info += _(' (%s reserved)') % str(reserved_available)
-----
```

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #: code:addons/stock/stock.py:1677

格式为 #: code:python 代码相对根目录的文件名:第几行(相差同行没关

系)

注意一下 code:addons... 一般第三方代码不会放在 addons 下

一般新建一个目录 addonscustom ,这时这里要相应的更改

第三行 #, python-format 是 python 代码，这个照写就可以看到代码中可以翻译的字符，都用 \_()引起来了

@ 弹出窗体提醒翻译

```
#. module: stock
#: code:addons/stock/stock.py:3922
#, python-format
msgid "Warning: wrong UoM!"
msgstr "警告！错误的计量单位！"
```

```

-----
if selected_uom.category_id.id != product.uom_id.category_id.id:
    res['warning'] = {
        'title': _('Warning: wrong UoM!'),
        'message': _('The selected UoM for product %s is not compatible
with the UoM set
on the product form. \nPlease choose an UoM within the same
UoM category.') % (product.name)
    }
-----

```

@字段翻译

```

#. module: stock
#: field:stock.warehouse,partner_id:0
msgid "Address"
msgstr "地址"
-----

```

addons/stock/stock.py

```

class stock_warehouse(osv.osv):
    _name = "stock.warehouse" #模型名
    _description = "Warehouse"

    _columns = {
        ...
        'partner_id': fields.many2one('res.partner', 'Address'),
        ...
    }
-----

```

stock\_view.xml 对应的视图显示

```

<record id="view_warehouse_tree" model="ir.ui.view">
    <field name="name">stock.warehouse.tree</field>
    <field name="model">stock.warehouse</field>
    <field name="arch" type="xml">
        <tree string="Warehouse">
            <field name="name"/>
            <field name="lot_stock_id" groups="stock.group_locations"/>
            <field name="partner_id"/>
        </tree>
    </field>
</record>
-----

```

第一行 `#. module: stock` 格式为 `#. module:` 模块的目录名

第二行 `#: field:stock.warehouse,partner_id:0`

格式为 `#: field:模型名:要翻译的字段名: 0`

`partner_id` 是在数据表中字段

`Address` 在显示名称

@ 字段帮助翻译

`#. module: stock`

`#: help:stock.config.settings,group_uom:0`

`msgid "Allows you to select and maintain different units of measure for products."`

`msgstr "允许你选择和维护产品的不同计量单位"`

-----

`res_config.py`

`class stock_config_settings(osv.osv_memory):`

`_name = 'stock.config.settings'`

`_inherit = 'res.config.settings'`

`_columns = {`

`...`

`'group_uom': fields.boolean("Manage different units of measure for products",`

`implied_group='product.group_uom',`

`help="""Allows you to select and maintain different units of measure for products."""),`

`...`

-----

`res_config_view.xml`

`<record id="view_stock_config_settings" model="ir.ui.view">`

`<field name="name">stock settings</field>`

`<field name="model">stock.config.settings</field>`

`...`

`<div>`

`<field name="group_uom" class="oe_inline"/>`

`<label for="group_uom"/>`

`</div>`

`...`

-----

第一行 `#. module: stock` 格式为 `#. module:` 模块的目录名

第二行 `#: help:stock.config.settings,group_uom:0`

格式为 `#: help:模型名,字段名`

@ 窗体 xml 帮助翻译

```
#. module: stock
#: model:ir.actions.act_window,help:stock.action_warehouse_form
msgid ""
"<p class=\"oe_view_nocontent_create\">\n"
"        Click to define a new warehouse.\n"
"    </p>\n"
"    "
msgstr ""
"<p class=\"oe_view_nocontent_create\">\n"
"        单击定义新仓库\n"
"    </p>\n"
"    "
```

-----

stock\_view.xml

```
<record id="action_warehouse_form" model="ir.actions.act_window">
  <field name="name">Warehouses</field>
  <field name="res_model">stock.warehouse</field>
  <field name="type">ir.actions.act_window</field>
  <field name="view_type">form</field>
  <field name="view_id" ref="view_warehouse_tree"/>
  <field name="help" type="html">
    <p class="oe_view_nocontent_create">
      Click to define a new warehouse.
    </p>
  </field>
</record>
```

-----

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #:

model:ir.actions.act\_window,help:stock.action\_warehouse\_form

格式为 #: model:ir.actions.act\_window,help:模块的目录名.id 名

第三行 把 name="help" 容器中的内容拷贝出来翻译

@ 视图中文字翻译

```
#. module: stock
#: view:stock.location.route:stock.stock_location_route_form_view
msgid "Applicable On"
```

msgstr "适用于"

-----

stock\_view.xml

```
<record id="stock_location_route_form_view" model="ir.ui.view">
  <field name="name">stock.location.route.form</field>
  <field name="model">stock.location.route</field>
  ...
  <separator string="Applicable On"/>
  ...
```

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #:

view:stock.location.route:stock.stock\_location\_route\_form\_view

格式为 #: view:模型名:模块的目录名.视图的 id 名

第三行 msgid "Applicable On" 把视图对应要翻译的那段复制过来

这里是放在 string="str"

有<p>str</p>

这里适应较多情况:

@ 搜索翻译

#. module: stock

#: view:stock.picking:stock.view\_picking\_internal\_search

msgid "Draft"

msgstr "草稿"

@ 搜索帮助翻译

#. module: stock

#: view:stock.picking:stock.view\_picking\_internal\_search

msgid "Draft Moves"

msgstr "迁移草稿"

----

stock\_view.xml

```
<record id="view_picking_internal_search" model="ir.ui.view">

filter_domain="[('name','ilike', self),('origin','ilike',self)]"/>
      <filter icon="terp-check" name="draft" string="Draft"
domain="[('state','=', 'draft')]" help="Draft Moves"/>
    </search>
  </field>
</field>
```

```

....
-----
@ 界面按钮翻译
#. module: stock
#: view:stock.move:stock.view_move_tree
msgid "Process"
msgstr "处理"
-----
stock_view.xml

<record id="view_move_tree" model="ir.ui.view">
    <field name="name">stock.move.tree</field>
    <field name="model">stock.move</field>
    ...
    <button name="action_done" states="confirmed,assigned"
string="Process" type="object"
                groups="stock.group_stock_user"
icon="gtk-go-forward" help="Done"/>
-----

@ 报表界面翻译
#. module: stock
#: model:ir.actions.report.xml,name:stock.action_report_lot_barcode
msgid "Lot BarCode"
msgstr "批次条码"
-----
stock_report.xml
<report id="action_report_lot_barcode" model="stock.production.lot"
    report_type="qweb-pdf" name="stock.report_lot_barcode"
    string="Lot BarCode" file="stock.report_lot_barcode"/>
-----
第一行 #. module: stock 格式为 #. module: 模块的目录名
第二行 #:
model:ir.actions.report.xml,name:stock.action_report_lot_barcode
        格式为 #: model:ir.actions.report.xml,name:模块的目录名.报表 id 名
第三行    msgid "Lot BarCode" 报表里的 string 内容拷贝出来翻译

@ 下拉选择内容翻译
#. module: stock
#: selection:stock.move,state:0
msgid "Available"

```

```

msgstr "可用"
-----
stock.py
class stock_move(osv.osv):
    _name = "stock.move"
    _description = "Stock Move"
    ...
    _columns = {
    ...
        'state': fields.selection([('draft', 'New'),
                                   ('cancel', 'Cancelled'),
                                   ('waiting', 'Waiting Another Move'),
                                   ('confirmed', 'Waiting Availability'),
                                   ('assigned', 'Available'),
                                   ('done', 'Done'),
                                   ], 'Status', readonly=True, select=True, copy=False,
    ...

```

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #: selection:stock.move,state:0

格式为 #:selection:模型名,字段名

第三行 msgid "Available" 下拉选择项的显示名称

#### @ 菜单翻译

```

#. module: stock
#: model:ir.ui.menu,name:stock.menu_stock_inventory_control
msgid "Inventory Control"
msgstr "盘点管理"
-----
stock_view.xml

```

```

<menuitem id="menu_stock_inventory_control" name="Inventory
Control" parent="menu_stock_root" sequence="2"/>

```

```

-----
第一行 #.module: stock 格式为 #. module: 模块的目录名
第二行 #: model:ir.ui.menu,name:stock.menu_stock_inventory_control
      格式为 #: model:ir.ui.menu,name:模块的目录名.id 名
第三行 msgid "Inventory Control" 显示名称

```

#### @ 窗体事件翻译

```

#. module: stock

```

```
#: model:ir.actions.act_window,name:stock.do_view_pickings
msgid "Pickings for Groups"
msgstr "分组分拣"
```

-----

stock\_view.xml

```
<record id="do_view_pickings" model="ir.actions.act_window">
  <field name="name">Pickings for Groups</field>
  <field name="res_model">stock.picking</field>
  <field name="view_type">form</field>
  <field name="view_mode">tree,form</field>
  <field name="domain">[('group_id','=',active_id)]</field>
</record>
```

-----

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #: model:ir.actions.act\_window,name:stock.do\_view\_pickings  
格式为 #: model:ir.actions.act\_window,name:模块的目录名.窗体事件

id 名

第三行 msgid "Pickings for Groups" 显示名称 视图有对应的拷贝过来就可

@ 客户事件翻译

```
#. module: stock
```

```
#: model:ir.actions.client,name:stock.action_client_warehouse_menu
```

```
msgid "Open Warehouse Menu"
```

```
msgstr "打开仓库菜单"
```

-----

res\_config\_view.xml

```
<record id="action_client_warehouse_menu" model="ir.actions.client">
  <field name="name">Open Warehouse Menu</field>
  <field name="tag">reload</field>
  <field name="params" eval="{ 'menu_id':
ref('menu_stock_root') }"/>
</record>
```

-----

第一行 #. module: stock 格式为 #. module: 模块的目录名

第二行 #:

model:ir.actions.client,name:stock.action\_client\_warehouse\_menu

格式为 #: model:ir.actions.client,name:模块的目录名.客户事件 id 名

第三行 msgid "Open Warehouse Menu" 显示名称 视图有对应的拷贝过来就

可

#### @ 数据表名称翻译

在本地安装模块时就会显示中文了

```
#. module: stock
#: model:ir.model,name:stock.model_stock_inventory_line
msgid "Inventory Line"
msgstr "盘点表明细"
-----
stock.py
```

```
class stock_inventory_line(osv.osv):
    _name = "stock.inventory.line"
    _description = "Inventory Line"
```

```
-----
第一行 #. module: stock  格式为 #. module: 模块的目录名
第二行 #: model:ir.model,name:stock.model_stock_inventory_line
        格式为 #: model:ir.model,name:模块的目录名 model_对象类名
第三行 msgid "Inventory Line" 类名的描述
权限设定时，也是采用 model_对象类名
```

#### @ 权限组翻译

```
#. module: stock
#: model:res.groups,name:stock.group_tracking_owner
msgid "Manage Different Stock Owners"
msgstr "管理不同库存拥有者"
-----
security/stock_security.xml
```

```
<record id="group_tracking_owner" model="res.groups">
    <field name="name">Manage Different Stock Owners</field>
    <field name="category_id" ref="base.module_category_hidden"/>
</record>
```

```
-----
第一行 #. module: stock  格式为 #. module: 模块的目录名
第二行 #: model:res.groups,name:stock.group_tracking_owner
        格式为 #: model:res.groups,name:模块的目录名.分组 id 名
第三行 msgid "Manage Different Stock Owners" 权限组显示名称
```

#### @ 插入带的翻译

```

#. module: stock
#: model:stock.location,name:stock.location_inventory
msgid "Inventory loss"
msgstr "盘点盈亏"
-----
<record id="location_inventory" model="stock.location">
  <field name="name">Inventory loss</field>
  <field name="location_id" ref="stock_location_locations_virtual"/>
  <field name="usage">inventory</field>
  <field name="company_id"></field>
</record>
-----

```

第一行 `#. module: stock` 格式为 `#. module: 模块的目录名`

第二行 `#: model:stock.location,name:stock.location_inventory`

格式为 `#: model:模型名,name:模块的目录名.id 名` 或 `note:模块的目录名.id 名`

注：总是翻译无效时，可以搜索旁边的 翻译，从而参照 写翻译条

## (14)odoo 加载机制

Odoo 的启动通过 `openerp-server` 脚本完成，它是系统的入口。

然后加载配置文件 `openerp-server.conf` 或者 `.openerp_serverrc`：

`openerp-server.conf` 的主要内容：

这个文件缺省是没有的，Odoo 系统会有一个默认值，但是一般情况我们都需配置这个文件。启动 `http` 服务器，监听端口。

模块加载：

模块加载外层就是封装一个 `Registry(Mapping)` 对象：实际是一个字典，它包含对应的 `db`，`model` 等映射关系，一个 `DB` 对应一个 `Registry`。后续的操作都会围绕这个 `Registry` 进行，将相关的数据赋值给相应的属性项。

上面这行代码开始真正的模块加载：

### 1. 初始化数据库（初次运行）

1)加载 `base` 模块下的 `base.sql` 文件并执行。

此时数据库表为：

这 20 张表是 `odoo` 系统级的，它是模块加载及系统运行的基础。后续模块生成的表及相关数据都可以在这 20 张中找到蛛丝马迹。

2)数据库表初始化后，就可以加载模块数据（`addons`）到数据库了，这个也是 `odoo` 作为平台灵活的原因，所有的数据都在数据库。

找到 `addons-path` 下所有的模块，然后一个一个的加载到数据库中。

`Info` 就是 `load` 模块的 `__openerp__.py` 文件，它是一个 `dict`。

根据 `__openerp__.py` 中定义的 `category` 创建分类信息：

将模块信息写入 `ir_module_module` 表：

将 `module` 信息写入 `ir_model_data` 表：

一个 `module` 要写两次 `ir_model_data` 表，

写 `module` 的 `dependency` 表：

根据依赖关系进行判断，递归更新那些需要 `auto_install` 的模块状态为“to install”。

到目前为止，模块的加载都是在数据库级别，只是将“模块文件”信息存入数据库表，但是还没有真正加载到程序中。

Odoo 运行时查找 `object` 是通过 `Registry.get()` 获取的，而不是通过 `python` 自己的机制来找到相应的 `object`，所以 `odoo` 在加载模块时会把模块下包含的 `model` 全部注册到 `models.py` 的 `module_to_models` 字典中。

下面的步骤就是加载模块到内存：

### 3)加载 `base` 模块

创建一个包含 `model` 层级的节点图，第二行代码将从数据库更新数据到 `graph` 中。然后调用 `load_module_graph` 方法加载模块，最终执行加载的方法：

这个方法是 `odoo` 加载 `model` 的核心，通过 `__import__` 方法加载模块，这个是 `python`

的机制，当 `import` 到某个继承了 `BaseModel` 类的 `class` 时，它的实例化将有别于 `python` 自身的实例化操作，

后者说它根本不会通过 `python` 自身的 `__new__` 方法创建实例，所有的实例创建都是通过 `_build_model` 方法及元类创建，并注册到 `module_to_models` 中。通过这种方式实例化 `model` 就可以解决我们在 `xml` 中配置 `model` 时指定的继承，字段，约束等各种属性。

- 4) 标记需要加载或者更新的模块 (`db`)
- 5) 加载被标记的模块 (加载过程与加载 `base` 模块一致)
- 6) 完成及清理安装
- 7) 清理菜单
- 8) 删除卸载的模块
- 9) 核实 `model` 的 `view`
- 10) 运行 `post-install` 测试

## (15)odoo 配置文件详解

openerp-server.conf

-----

[options]

; addons 模块的查找路径

addons\_path = E:\GreenOdoo8.0\source\openerp\addons

; 管理员主控密码(用于创建、还原和备份数据库等操作)

admin\_passwd = admin

; 自动重载?

auto\_reload = None

; 用于导入导出的 csv 文件的默认分隔符

csv\_internal\_sep = ,

; data 目录, 用于存放 session 信息、附件

data\_dir = data

; 数据库主机名

db\_host = 127.0.0.1

; 数据库的最大连接数

; 哪些模块加载 demo 数据?

demo = {}

; 用于发送邮件的邮箱地址

email\_from = False

; 在导入大量数据时使用这个选项, 如果在导入期间程序宕机, 你可以在当前状态下继续。

指定一个存储中间导入状态的文件名。

import\_partial =

; 一个处理器允许使用的最大物理内存  
 limit\_memory\_hard = None  
 ; 一个处理器允许使用的最大虚拟内存  
 limit\_memory\_soft = None  
 ; 一个处理器接受的最大请求数  
 limit\_request = None  
 ; 一个请求最多占用多少处理器时间  
 limit\_time\_cpu = None  
 ; 一个请求允许的最长实时时间  
 limit\_time\_real = None  
 ; 是否允许显示数据库列表  
 list\_db = True  
 ; 是否将 log 写入 db 的 ir\_logging 表  
 log\_db = False  
 ; 可以是一组 module:log\_level 对, 默认值是:INFO(表示所有模块的默认日志级别为 INFO 级别)  
 log\_handler = :INFO  
 ; 日志的级别, 可选值包括 debug\_rpc\_answer, debug\_rpc, debug, debug\_sql, info, warn, error, critical  
 log\_level = info  
 ; 指定用来存储日志的文件  
 logfile = openerp-server.log  
 ; 是否按天存放日志  
 logrotate = False  
 ; 长连接池使用的端口号?  
 longpolling\_port = 8072  
 ; 处理当前计划任务的最大线程数  
 max\_cron\_threads = 2  
 ; 强制保存在 virtual osv\_memory 表中的记录的最长时间, 以小时为单位  
 osv\_memory\_age\_limit = 1.0  
 ; 强制一个 virtual osv\_memory 表的最大记录数  
 osv\_memory\_count\_limit = False  
 ; 数据库可执行文件的路径  
 pg\_path = runtime/pgsql/bin  
 ; 存储服务器 pid 的文件名  
 pidfile = None  
 ; 是否使用反向代理模式  
 proxy\_mode = False  
 ; 是否压缩报表  
 reportgz = False  
 ; 指定用于 SSL 连接的证书文件

```

secure_cert_file = server.cert
; 指定用于 SSL 连接的主密钥文件
secure_pkey_file = server.pkey
; server 范围的模块,以逗号分隔
server_wide_modules = None

; SMTP 服务器是否支持 SSL 协议
smtp_ssl = False
; 发送邮件的 SMTP 用户名
smtp_user = False
; 是否把日志发送给系统日志服务器
syslog = False
; 是否提交 YAML 或 XML 测试造成的数据库更改
test_commit = False
; 是否允许 YAML 和单元测试
test_enable = False
; YML 测试文件
test_file = False
; 报表的范例的存放位置
test_report_directory = False
; 为系统提供一个参照的时区
timezone = False
; 哪些模块可翻译, 默认为 all
translate_modules = ['all']
; 是否使用数据库的 unaccent 功能
unaccent = False
; 在安装时哪些模块不加载演示数据
without_demo = False
; 要使用的处理器数量
workers = None
; 是否允许使用 XML-RPC 协议, 默认为 True
xmlrpc = True
; 指定使用 XML-RPC 协议的 IP 地址, 为空时表示绑定到现有 IP
xmlrpc_interface =
; XML-RPC 协议使用的 TCP 端口
xmlrpc_port = 8069

```

; 是否允许使用 XML-RPC 安全协议，默认为 True  
xmlrpcs = True; 指定使用 XML-RPC 安全协议的 IP 地址，为空时表示绑定到现有  
IPxmlrpcs\_interface = ; XML-RPC 安全协议使用的 TCP 端口 xmlrpcs\_port = 8071

-----

Odoo 使用 Python 标准日志库 logging。它使用一种特殊的配置语法来为其模块配置日志级别。

以下为 Odoo 日志配置的完整选项(一般放在 openerp-server.conf 文件中):

logfile: 日志文件名，比如 opt/odoo.log。如果不设置，则默认为 stdout，即输出到控制台

logrotate: True/False.如果设置 True,每天创建一个文件，并且保存 30 天的日志文件

log\_db: True/False. 如果设置为 True，日志会写入数据库中的“ir\_logging”表中

log\_level: 日志级别，可以为列表中的任意一项 ['debug\_rpc\_answer', 'debug\_rpc', 'debug', 'debug\_sql', 'info', 'warn', 'error', 'critical']。Odoo 设置此日志级别选项的意义在于因为这些级别值被映射到了一个预先定义好的“module:log\_level”键值对集合，即使这个选项没有被设置，Odoo 则会使用预先定义的设置作为默认设置。具体内容参见下面的日志实现章节。

log\_handler: 值可以为“module:log\_level”键值对。“Module”表示模块名，比如：“openerp.addons.account”或者 “openerp.addons.\*”。“log\_level”默认值为“INFO” -- 也即是对所有模块来说，默认的日志级别就是'INFO'

## (16)odoo8 API 指南

<http://odoo-new-api-guide-line.readthedocs.org/en/latest/index.html>

## (17)odoo 方法和修饰器

\* 方法和修饰器

api 是命名修饰器，识别 cr,cursor, uid, user, user\_id, id, ids, context

# @api.returns

返回指定模型的记录集

```
@api.returns('res.partner')
```

```
def afun(self):
```

```
    ...
```

```
    return x # a RecordSet
```

这样就返回合作伙伴记录集

# @api.one

返回当前记录，指明下面 self 是一条记录

```
@api.one
```

```
def afun(self):
```

```
    self.name = 'toto'
```

# @api.multi

返回记录集，指明下面的 self 是记录集

```
@api.multi
```

```
def afun(self):
```

```
    len(self)
```

# @api.model

保证兼容版本，指明下面的 self 是模型对象

```
@api.model
```

```
def afun(self):
```

```
    pass
```

# @api.constrains

保证关系时的约束

# @api.depends

给定好依赖,表示依赖字段值变化，本字段值也跟着变化

```
@api.depends('name', 'an_other_field')
```

```
def afun(self):
```

```
pass
```

```
# @api.onchange
    监控字段的变化，然后操作响应
@api.onchange('fieldx')
def do_stuff(self):
    if self.fieldx == x:
        self.fieldy = 'toto'
```

## (18)odoo 规范

### \* 约定

# 命名会用 蛇形式或驼峰式  
    todo\_task\_stage 蛇形式  
    class TodoTask 驼峰式  
变量名还是蛇形居多， 类名和方法名驼峰式居多

# 模式  
    from openerp import models

# 字段  
    from openerp import fields

# 翻译  
    from openerp import \_

# 接口  
    from openerp import api

# 异常  
    from openerp import exceptions

# 典型模块导入  
    from openerp import models,fields,api,\_

# 类  
    class Toto(models.Model):  
        pass  
  
    class Titi(models.TransientModel):  
        pass

# 新的异常类  
    openerp.exceptions.Warning

# 字段  
    定义词义比较好的，不要一味缩写

# 在模型中，不要去改变 **self** 用一个方法，否则缓存都无效了

```
# 数据库句柄 用当前的 self.env.cr
```

```
# 约束 用上 @api.constrains
```

## (19)odoo 中的 javascript

\* 用到的 js 库

我们可以打开 addons/web/views/webclient\_template.xml

看到如下：

```
<template id="web.assets_common">
  <script type="text/javascript"
src="/web/static/lib/es5-shim/es5-shim.min.js"></script>
  <script type="text/javascript"
src="/web/static/lib/underscore/underscore.js"></script>
  <script type="text/javascript"
src="/web/static/lib/underscore.string/lib/underscore.string.js"></script>
  <script type="text/javascript"
src="/web/static/lib/datejs/globalization/en-US.js"></script>
  <script type="text/javascript"
src="/web/static/lib/spinjs/spin.js"></script>

  <!-- jQuery stuff -->
  <script type="text/javascript"
src="/web/static/lib/jquery/jquery.js"></script>
  <script type="text/javascript"
src="/web/static/lib/jquery.blockUI/jquery.blockUI.js"></script>
  <script type="text/javascript"
src="/web/static/lib/jquery.hotkeys/jquery.hotkeys.js"></script>
  <script type="text/javascript"
src="/web/static/lib/jquery.placeholder/jquery.placeholder.js"></script>
  <script type="text/javascript"
src="/web/static/lib/jquery.timeago/jquery.timeago.js"></script>
  <script type="text/javascript"
src="/web/static/lib/jquery.form/jquery.form.js"></script>

  <script type="text/javascript"
src="/web/static/lib/jquery.ba-bbq/jquery.ba-bbq.js"></script>

  <script type="text/javascript"
src="/web/static/lib/qweb/qweb2.js"></script>
  <script type="text/javascript"
src="/web/static/src/js/openerpframework.js"></script>
  <script type="text/javascript"
src="/web/static/src/js/tour.js"></script>

  <link rel="stylesheet"
href="/web/static/lib/fontawesome/css/font-awesome.css"/>
```

```

</template>
# es5-shim 给傻逼浏览器做兼容性，使得傻逼浏览器可以支持一些 es5 的 api
# spinjs ajax 异步时，等待出现一个轮的图片
# datejs 日期处理 js
# jQuery 库，这是经典库了 http://t.mb5u.com/jquery/ 1.8.3
# jquery.blockUI 提示窗口
# jquery.hotkeys 键盘 js 处理
# jquery.placeholder 实现文本框显示描述文字
# jquery.timeago 时间格式
# jquery.form 表单处理
# jquery.ba-bbq
# underscore 库，弥补了 jQuery 没有实现的地方 文档
http://www.css88.com/doc/underscore1.6.0/
    所有的功能都封装在名为 "_" 命名空间内
    常用_.each()来代替 javascript 中的循环
    _.range()产生一个范围的数列
    function sumTotal(){
        var x=0;
        _.each(_.range(1,101),function(i){
            x+=i;
        });
        console.log("Result", x);
    }

*jQuery 简单操作
# 选择器
    @ $("input") 选择特定的 HTML 元素
    @ $("#content") 选择指定的 id 的 HTML 元素
    @ $(".title") 选择明确的 css 样式类的所有元素
    @ $("span.title") 组合选择元素，可以更精确选择元素

# 事件
    @ $("button").click(function){
        console.log("someone clicked on the button")
    }); // 按钮上的单点事件

# 修改 DOM
    @ $(".main_content").html('<div style="color:white">Hello world!'
</div> <!--替换内容-->
    @ $(".main_content").append('<div style="color:white">Hello world
again!' </div> <!--追加内容到后面-->

```

```
@ $(".main_content").prepend('<div style="color:white">Hello world  
front!' </div>) <!--追加内容到前面-->
```

放文本用 `text()`

```
$(".main_content").text('The <div> element will appear as-is in the  
browser.');
```

# 异步调用

服务端:

```
@app.route('/service_plus', methods=["POST"])  
def service_plus():  
    data = flask.request.json  
    a = data["a"]  
    b = data["b"]  
    delay = data.get("delay", 0)  
    time.sleep(delay)  
    return flask.jsonify(**{  
        "addition": a + b,  
    })
```

客户端:

```
$.ajax("/service_plus", {  
    type: "POST",  
    dataType: "json",  
    data: JSON.stringify({  
        "a": 3,  
        "b": 5,  
    }),  
    contentType: "application/json",  
}).then(function(a) {  
    console.log("3+5=", a.addition);  
});
```

说明:

@ `JSON.stringify` 把字典转换为 json

@ `flask.jsonify` 返回 json 串

在所有的处理异步操作中，总是返回一个 `deferred`

```
function func1() {  
    var def1 = $.ajax(...); // A first call to the server.  
    var def2 = $.ajax(...); // A second call.  
    var def3 = $.when(def1, def2); // We multiplex all that.
```

```

    var def4 = def3.then(...); // Some more complexity: we chain it.
    // Now we don't forget to return a deferred that represents the
complete
    operation.
    return def4;
};
function func2() {
    var def = func1(); // We want to call func1().
    // Now if I need to know when func1() has finished all its
operations I h
    ave a deferred that represents that.
    var def2 = def.then(...);
    // And finally we don't forget to return a deferred because func2()
is, b
    y transitivity, a function
    // that performs an asynchronous call. So it should return a
deferred too.
    return def2;
};

```

\*模块定义

```

(function() {
    app = {};
    function main() {
        console.log("launch application");
    };
    app.main = main;
})();

```

采用匿名函数封装

\* 例子

```

function openerp_picking_widgets(instance){

    var module = instance.stock;
    var _t    = instance.web._t;
    var _lt = instance.web._lt;
    var QWeb  = instance.web.qweb;

    // This widget makes sure that the scaling is disabled on mobile devices.
    // Widgets that want to display fullscreen on mobile phone need to extend

```

```

this
  // widget.

  module.MobileWidget = instance.web.Widget.extend({
    start: function(){
      if(!$('#oe-mobilewidget-viewport').length){
        $('#head').append('<meta id="oe-mobilewidget-viewport"
name="viewport" content="initial-scale=1.0; maximum-scale=1.0;
user-scalable=0;">');
      }
      return this._super();
    },
    destroy: function(){
      $('#oe-mobilewidget-viewport').remove();
      return this._super();
    },
  });

  #var _t    = instance.web._t; 翻译

```

\* 采用异步 做  $(a+b)*(c+d)$  这个功能，这是例子，主要参考模式思想

```

(function(){
  app = {};

  function main(){
    $("button").click(function(){
      plusmultplus(1,2,3,4).then(function(result){
        console.log("(1+2)*(3+4)=",result.multiplication);
      });
    });
  }

  app.main = main;

  function plusmultplus(a,b,c,d){
    var def1 = $.ajax("/service_plus",{
      type:"POST",
      dataType:"json",
      data:JSON.stringify({
        "a":a,
        "b":b,

```

```

    }),
    contentType:"application/json",
  });

  var def2 = $.ajax("/service_plus",{
    type:"POST",
    dataType:"json",
    data:JSON.stringify({
      "c":c,
      "d":d,
    }),
    contentType:"application/json",
  });

  return $.when(def1,def2).then(function(result1,result2){
    return $.ajax("/service_mult",{
      type:"POST",
      dataType:"json",
      data:JSON.stringify({
        "a":result1[0].addition,
        "b":result2[0].addition,
      }),
      contentType:"application/json",
    });
  });
}

```

```

})();

```

```

-----
@app.route('/service_plus', methods=["POST"])
def service_plus():
    data = flask.request.json
    a = data["a"]
    b = data["b"]
    delay = data.get("delay", 0)
    time.sleep(delay)
    return flask.jsonify(**{
        "addition": a + b,

```

```
})
```

```
@app.route('/service_mult', methods=["POST"])
def service_mult():
    data = flask.request.json
    a = data["a"]
    b = data["b"]
    delay = data.get("delay", 0)
    time.sleep(delay)
    return flask.jsonify(**{
        "multiplication": a * b,
    })
```

\* Web Framework 构造图形化的 javascript 应用

# 基础框架 js 所在位置 addons/web/static/src/js/openerpframework

#js 在 odoo 中的运用

```
openerp.oepetstore = function(instance) {
    var _t = instance.web._t,
        _lt = instance.web._lt;
    var QWeb = instance.web.qweb;
    instance.oepetstore = {};
    instance.oepetstore.HomePage = instance.web.Widget.extend({
        start: function() {
            console.log("pet store home page loaded");
        },
    });

    instance.web.client_actions.add('petstore.homepage',
'instance.oepetstore.HomePage');
}
```

@ odoo 运行时会把所有的 javascript 文件连接为一个文件，然后压缩，若要调试，必须采用 debug 模式

@ 上面创建了， oepetstore 模块，且做为属性放在全局变量 openerp 中；模块名和 addon 的模块名要一

致，否则不能运行

@ 当载入 addon 这个模块时,该 js 模块调用，传入 instance 参数，这个参数代表当前 OpenERP 的 Web 客户端实例，

包含了所有相关当前会话数据， 以及所有 Web 模块的变量

@ instance.oepetstore = {}; 这是命名空间，用来声明我们模块内自己使用的所有类和变量

# js 在 odoo 定义一个新类

```
instance.oepetstore.MyClass = instance.web.Class.extend({
  say_hello: function(){
    console.log("hello");
  }
});
```

@ 调用 instance.web.Class.extend() 传入一个 dictionary 参数

@ 在方法内，用 this 访问属性值

```
instance.oepetstore.MyClass = instance.web.Class.extend({
  say_hello: function() {
    console.log("hello", this.name);
  },
});
var my_object = new instance.oepetstore.MyClass();
my_object.name = "Nicolas";
my_object.say_hello();
```

@ 类可以有一个构造函数 init()

```
instance.oepetstore.MyClass = instance.web.Class.extend({
  init: function(name) {
    this.name = name;
  },
  say_hello: function() {
    console.log("hello", this.name);
  },
});
```

```
var my_object = new instance.oepetstore.MyClass("Nicolas");
my_object.say_hello();
```

@ 重载方法时，使用 this.\_super()调用原来的方法

```
instance.oepetstore.MySpanishClass =
instance.oepetstore.MyClass.extend({
  say_hello: function() {
    this._super();
    console.log("translation in Spanish: hola", this.name);
  },
});
var my_object = new instance.oepetstore.MySpanishClass("Nicolas");
```

```
my_object.say_hello();
```

## \* Widgets

# 第一个部件

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
  start: function() {
    console.log("pet store home page loaded");
  },
});
```

```
instance.web.client_actions.add('petstore.homepage',
'instance.oepetstore.HomePage');
```

这句是把这个部件注册为客户端的 action

@ start 这个方法部件初始化会自动调用

@ 改造一下用上 jQuery 的 \$el

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
  start: function() {
    this.$el.append("<div>Hello dear OpenERP user!</div>")
  },
});
```

# 实例化部件

```
instance.oepetstore.GreetingsWidget = instance.web.Widget.extend({
  start: function() {
    this.$el.addClass("oe_petstore_greetings");
    this.$el.append("<div>We are so happy to see you again in this
menu!</div>");
  },
});
```

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
  start: function() {
    this.$el.addClass("oe_petstore_homepage");
    this.$el.append("<div>Hello dear OpenERP user!</div>");
    var greeting = new instance.oepetstore.GreetingsWidget(this);
    greeting.appendTo(this.$el);
  },
});
```

显示结果:

```
<div class="oe_petstore_homepage">
  <div>Hello dear OpenERP user!</div>
  <div class="oe_petstore_greetings">
    <div>We are so happy to see you again in this menu!</div>
  </div>
</div>
```

```
@ new instance.oepetstore.GreetingsWidget(this); 实例化部件
this 参数, 在这里代表 HomePage 实例, 部件有父子关系
instance.oepetstore.GreetingsWidget = instance.web.Widget.extend({
  start: function() {
    console.log(this.getParent().$el );
    // will print "div.oe_petstore_homepage" in the console
  },
});
```

-----

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
  start: function() {
    var greeting = new instance.oepetstore.GreetingsWidget(this);
    greeting.appendTo(this.$el);
    console.log(this.getChildren()[0].$el);
    // will print "div.oe_petstore_greetings" in the console
  },
});
```

@ 当重载部件的 init() 时, 必须以父部件作为第一参数传入, 并调用传入给 this.\_super()

```
instance.oepetstore.GreetingsWidget =
instance.web.Widget.extend({
  init: function(parent, name) {
    this._super(parent);
    this.name = name;
  },
});
```

当一个部件没有父部件时, 实例化传 null 参数

# 销毁部件

```
greeting.destory()
```

# 事件

```
instance.oepetstore.ConfirmWidget = instance.web.Widget.extend({
```

```

start: function() {
    var self = this;
    this.$el.append("<div>Are you sure you want to perform this
action?<
        /div>" +
        "<button class='ok_button'>Ok</button>" +
        "<button class='cancel_button'>Cancel</button>");
    this.$el.find("button.ok_button").click(function() {
        self.trigger("user_choose", true);
    });
    this.$el.find("button.cancel_button").click(function() {
        self.trigger("user_choose", false);
    });
},
});

```

```

instance.oepetstore.HomePage = instance.web.Widget.extend({
    start: function() {
        var widget = new instance.oepetstore.ConfirmWidget(this);
        widget.on("user_choose", this, this.user_choose);
        widget.appendTo(this.$el);
    },
    user_choose: function(confirm) {
        if (confirm) {
            console.log("The user agreed to continue");
        } else {
            console.log("The user refused to continue");
        }
    },
});

```

@ this 隐式传入到所有的函数，每个已声明的函数都有自己的 this 。

所以，当我们在一个函数内声明了另一个函数，这个新功能将有自己的 this ，这和父函数 this 含义不同，采用了 var self = this; 保存

@ self.trigger("user\_choose", true); 定义 user\_choose 为名事件的触发器  
Widget.trigger(event\_name [, ...]) 方法的第一个参数是待触发的事件名，也接受任何数量的其他参数。这些参数将被传递到所有的事件侦听器

@ widget.on("user\_choose", this, this.user\_choose); 监听 user\_choose 事件

Widget.on(event\_name, object, func) 允许绑定一个事件 event\_name 触发时调

用的函数 func 。 如果 func) 是个方法，则 object 是 func) 函数的引用关联

对象。当 `func()` 被调用时，`trigger()` 的其他参数会传递给它

#### # 属性

和普通对象属性一样，但多了一个功能，会触发事件

```
start: function() {
    this.widget = ...
    this.widget.on("change:name", this, this.name_changed);
    this.widget.set("name", "Nicolas");
},
name_changed: function() {
    console.log("The new value of the property 'name' is",
this.widget.get("name"));
}
```

@ `Widget.set(name, value)` 方法设置某个属性的值。如果该值改变（或以前没有

值），对象将触发一个事件 `change:xxx`：xxx 是属性名称。

`Widget.get(name)` 读取属性值。

#### # 部件辅助工具

选择器 `this.$el.find("input.my_input") <=> this.$("input.my_input")`

要分析 jQuery 事件和部件事件

简化 jQuery 事件写法

```
start: function() {
    var self = this;
    this.$(".my_button").click(function() {
        self.button_clicked();
    });
}
-----
events: {
    "click .my_button": "button_clicked",
},
```

#### # 翻译

记得 js 源码有两行

```
var _t = instance.web._t,
    _lt = instance.web._lt;
```

这是导入翻译功能

```
this.$el.text(_t("Hello dear user!"));
```

和对应 python 代码中 `_()` 翻译  
`_lt()` 返回一个函数  
`var text_func = _lt("Hello dear user!");`  
`this.$el.text(text_func());`

`class openerp.Widget()`  
是所有可视化组件的基础类

# DOM Root

`Widget()` 得到 DOM Root  
`openerp.Widget.el` Root  
`openerp.Widget.$el` jQuery 打包  
`openerp.Widget.template` 生成 Root  
`openerp.Widget.tagName` 生成元素 默认是 div  
`openerp.Widget.id` 生成 Root 的 id 属性  
`openerp.Widget.className`  
`openerp.Widget.renderElement()` 渲染是生成 Root

# 使用 widget

`openerp.Widget.init(parent)`  
加元素  
`openerp.Widget.appendTo(element)` 加到后面  
`openerp.Widget.prependTo(element)` 加到前面  
`openerp.Widget.insertAfter(element)` 插在元素的后面  
`openerp.Widget.insertBefore(element)` 插在元素的前面  
  
`openerp.Widget.destory()` 清理  
`openerp.Widget.alive(deferred[, reject=false])` 状态操作  
`openerp.Widget.isDestroyed()` 检测有没有销毁

# 访问 DOM 内容

`openerp.Widget.$(selector)`  
`this.$(selector)`  
`this.$el.find(selector)`

# 重设 DOM Root

`openerp.Widget.setElement(element)`  
`element` 可以是元素，也可以 jQuery 对象

# DOM 事件处理

`openerp.Widget.events`

如

```
events:{
  'click p.oe_some_class a':'some_method',
  'change input':function(e){
    e.stopPropagation()
  }
}

openerp.Widget.delegateEvents() 代理绑定到 DOM 上面
openerp.Widget.undelegateEvents() 解绑
```

# 子类 Widget

通过 extend

```
var MyWidget = openerp.Widget.extend({
// QWeb template to use when rendering the object
template: "MyQWebTemplate",
events: {
  // events binding example
  'click .my-button': 'handle_click',
},
init: function(parent) {
  this._super(parent);
  // insert code to execute before rendering, for object
  // initialization
},
start: function() {
  var sup = this._super();
  // post-rendering initialization code, at this point

  // allows multiplexing deferred objects
  return $.when(
    // propagate asynchronous signal from parent class
    sup,
    // return own's asynchronous signal
    this.rpc(/* ... */)
  )
});

// Create the instance
var my_widget = new MyWidget(this);
// Render and insert into DOM
```

```
my_widget.appendTo(".some-div");
```

```
my_widget.destroy();
```

# 开发指南

@ 尽量少用 id ,万一要用 id 要用 `_.uniqueId()` 生成  
`this.id=_.uniqueId()`

@ 尽量少用普通 css 名字 如 content navigator

@ 尽量少用全局选择器 用 `Widget.$el` 或 `Widget.$()`

@ 所有的组件都要继承 `Widget()`

@ 要用 `QWeb` 进行 HTML 模板和渲染

\* `QWeb`

`instance.web.Widget` 特别支持 `QWeb`

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<templates xml:space="preserve">
```

```
<t t-name="HomePageTemplate">
```

```
<div style="background-color: red;">This is some simple
```

```
HTML</div>
```

```
</t>
```

```
</templates>
```

前面 js 源码, 有 `var QWeb = instance.web.qweb;` 这样可以用 `QWeb` 功能了

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
```

```
  start: function() {
```

```
    this.$el.append(QWeb.render("HomePageTemplate"));
```

```
  },
```

```
});
```

@ 渲染了 `HomePageTemplate` 模板

@ 也可以采用集成方式

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
```

```
  template: "HomePageTemplate",
```

```
  start: function() {
```

```
  },
```

```
});
```

发生在 `start` 方法之前, 会用模板的根标签替换部件的默认根标签

# 传递参数

```
<t t-name="HomePageTemplate">
```

```

    <div>Hello <t t-esc="name"/></div>
</t>
-----

```

```
QWeb.render("HomePageTemplate", {name: "Nicolas"});
```

当采用集成式，要用变量 widget

```

<t t-name="HomePageTemplate">
    <div>Hello <t t-esc="widget.name"/></div>
</t>
-----

```

```

instance.oepetstore.HomePage = instance.web.Widget.extend({
    template: "HomePageTemplate",
    init: function(parent) {
        this._super(parent);
        this.name = "Nicolas";
    },
    start: function() {
    },
});

```

# 模板基础 <https://doc.odoo.com/trunk/web/qweb/>

```

<templates>
    <t t-name="HomePageTemplate">
        <div>This is some simple HTML</div>
    </t>
</templates>

```

@ <templates> 模板的根元素

前缀 t-

@ t-name 标识模板， QWeb.render() 可以调用指定模板

@ t-esc 在 HTML 中放置文本 会转义 html 标签

@ t-raw 保持原有内容输出

@ t-if 条件语句

```

    <t t-if="true==true">
        true is true
    </t>

```

@ t-foreach t-as 循环

```

    <t t-foreach="names" t-as="name">
        <div>
            Hello <t t-esc="name" />
        </div>
    </t>

```

</t>

@ t-att-xx 设置属性值

\* 部件调用数据

```
class message_of_the_day(osv.osv):
    _name = "message_of_the_day"
    def my_method(self, cr, uid, context=None):
        return {"hello": "world"}

    _columns = {
        'message': fields.text(string="Message"),
        'color': fields.char(string="Color", size=20),
    }
```

-----

```
instance.oepetstore.HomePage = instance.web.Widget.extend({
    start: function() {
        var self = this;
        var model = new instance.web.Model("message_of_the_day");
        model.call("my_method", [], {context: new
instance.web.CompoundContext(
        xt())}).then(function(result) {
            self.$el.append("<div>Hello " + result["hello"] + "</div>");
            // will show "Hello world" to the user
        });
    },
});
```

#连接模型用 instance.web.Model

#采用 model.call()来调用数据 call(name, args, kwargs) 是 Model 的方法

args 是对象方法的参数列表

kwargs 命名参数列表，这里只传了 context

# 模型中的方法始终有一个参数 context , context 是一个包含多个 key 的

dictionary

# CompoundContext 这个类用来传递用户上下文（语言，时区等..） 给服务器的  
其构造函数的参数是任意数量的 dictionary

\* 部件较好的例子

```
openerp.oepetstore = function(instance) {
    var _t = instance.web._t,
        _lt = instance.web._lt;
    var QWeb = instance.web.qweb;
```

```

instance.oepetstore = {};
instance.oepetstore.HomePage = instance.web.Widget.extend({
    template: "HomePage",
    start: function() {
        var pettoys = new instance.oepetstore.PetToysList(this);
        pettoys.appendTo(this.$(".oe_petstore_homepage_left"));
        var motd = new instance.oepetstore.MessageOfTheDay(this);
        motd.appendTo(this.$(".oe_petstore_homepage_right"));
    },
});

instance.web.client_actions.add('petstore.homepage',
'instance.oepetstore.HomePage');

instance.oepetstore.MessageOfTheDay = instance.web.Widget.extend({
    template: "MessageofTheDay",
    init: function() {
        this._super.apply(this, arguments);
    },
    start: function() {
        var self = this;
        new
instance.web.Model("message_of_the_day").query(["message"]).
        first().then(function(result) {
            self.$(".oe_mywidget_message_of_the_day").text(result.messa
ge);
        });
    },
});

instance.oepetstore.PetToysList = instance.web.Widget.extend({
    template: "PetToysList",
    start: function() {
        var self = this;
        new instance.web.Model("product.product").query(["name",
"image"])
        .filter([["categ_id.name", "=", "Pet Toys"]]).limit(5).all().
        then(function(result) {
            _each(result, function(item) {
                var $item = $(QWeb.render("PetToy", {item: item}));
                self.$el.append($item);
            });
        });
    }
});

```

```

    },
  });
}

```

-----

```

<?xml version="1.0" encoding="UTF-8"?>
<templates xml:space="preserve">
  <t t-name="HomePage">
    <div class="oe_petstore_homepage">
      <div class="oe_petstore_homepage_left"></div>
      <div class="oe_petstore_homepage_right"></div>
    </div>
  </t>
  <t t-name="MessageofTheDay">
    <div class="oe_petstore_motd">
      <p class="oe_mywidget_message_of_the_day"></p>
    </div>
  </t>
  <t t-name="PetToysList">
    <div class="oe_petstore_pettoyslist">
    </div>
  </t>
  <t t-name="PetToy">
    <div class="oe_petstore_pettoy">
      <p><t t-esc="item.name"/></p>
      <p><img
t-att-src=""data:image/jpg;base64,'+item.image"/></p>
    </div>
  </t>
</templates>

```

```

.oe_petstore_homepage {
  display: table;
}
.oe_petstore_homepage_left {
  display: table-cell;
  width : 300px;
}
.oe_petstore_homepage_right {
  display: table-cell;
  width : 300px;
}

```

```

.o_e_petstore_motd {
    margin: 5px;
    padding: 5px;
    border-radius: 3px;
    background-color: #F0EEEE;
}
.o_e_petstore_pettoyslist {
    padding: 5px;
}
.o_e_petstore_petttoy {
    margin: 5px;
    padding: 5px;
    border-radius: 3px;
    background-color: #F0EEEE;
}

```

=====

#### \* RPC

采用异步的方式来调用

#高级 API

访问对象方法用 `openerp.Module`

映射服务端对象用 `call()` 和 `query()`

```
var Users = new openerp.Model('res.users');
```

```

    Users.call('change_password', ['oldpassword', 'newpassword'],
              {context: some_context}).then(function (result) {
        // do something with change_password result
    });

```

`query()`是 search+read 在后端操作

```

Users.query(['name', 'login', 'user_email', 'signature'])
    .filter(['active', '=', true], ['company_id', '=', main_company]))
    .limit(15)
    .all().then(function (users) {
        // do work with users records
    });

```

`openerp.Model.call(method[, args][, kwargs])`

`method` 是 rpc 的方法名

`args` 传入方法的参数

`kwargs` 关键词参数

`openerp.Model.query(fields)`

fields 字段列表

first() 取第一个记录

class openerp.web.Query(fields)类下方法

openerp.web.Query.all() 得到上面 query() 集的所有

openerp.web.Query.first() 要第一条，没有就是 null

openerp.web.Query.count() 得到的记录总数

openerp.web.Query.group\_by(grouping...) 分组来列表

openerp.web.Query.context(ctx) 添加上下文

openerp.web.Query.filter(domain) 条件过滤 domain 表达式

openerp.web.Query.offset(offset) 设定起点

openerp.web.Query.limit(limit) 设定要返回的数量

openerp.web.Query.order\_by(fields...) 记录排序

#聚合

```
some_query.group_by(['field1', 'field2']).then(function (groups) {  
    // do things with the fetched groups  
})
```

openerp.web.QueryGroup.get(key)

得到 key 的值，key 可以为：

@ grouped\_on

@ value

@ length

@ aggregates

openerp.web.QueryGroup.query([fields...]) 等价于

openerp.web.Model.query()

openerp.web.QueryGroup.subgroups()

#低级 API RPC 访问 python

openerp.session()

如：

```
openerp.session.rpc('/web/dataset/resequence', {  
    model: some_model,  
    ids: array_of_ids,  
    offset: 42  
}).then(function (result) {  
    // resequence didn't error out  
}, function () {
```

```

        // an error occurred during call
    });
=====
* Web 客户端
  写测试用例
  # 断言
    ok(state[, message])
    strictEqual(actual, expected[, message]) 相当于 ok(actual === expected,
message))
    notStrictEqual(actual, expected[, message]) 相当于 ok(actual !==
expected, message))
    deepEqual(actual, expected[, message])
    notDeepEqual(actual, expected[, message])
    throws(block[, expected[, message]) 抛出异常
    equal(actual, expected[, message]) 宽松相等
    notEqual(actual, expected[, message])

  示例:
  {
    'name': "Demonstration of web/javascript tests",
    'category': 'Hidden',
    'depends': ['web'],
    'js': ['static/src/js/demo.js'],
    'test': ['static/test/demo.js'],
  }
  // src/js/demo.js
  openerp.web_tests_demo = function (instance) {
    instance.web_tests_demo = {
      value_true: true,
      SomeType: instance.web.Class.extend({
        init: function (value) {
          this.value = value;
        }
      })
    };
  };

  // test/demo.js
  test('module content', function (instance) {
    ok(instance.web_tests_demo.value_true, "should have a true value");
    var type_instance = new instance.web_tests_demo.SomeType(42);
    strictEqual(type_instance.value, 42, "should have provided value");
  });

```

```
});
```

\* 显示图片

```

```

\* Web Components (Action manager)

# 看一列子:

```
<record model="ir.actions.act_window"  
id="message_of_the_day_action">  
  <field name="name">Message of the day</field>  
  <field name="res_model">message_of_the_day</field>  
  <field name="view_type">form</field>  
  <field name="view_mode">tree,form</field>  
</record>  
<menuitem id="message_day" name="Message of the day"  
parent="petstore_menu"  
action="message_of_the_day_action"/>
```

对应下的 js 处理, 没人 xml 快捷, 但用 js 更灵活

```
instance.oepetstore.PetToysList = instance.web.Widget.extend({  
  template: "PetToysList",  
  start: function() {  
    var self = this;  
    new instance.web.Model("product.product").query([["name", "image"]])  
      .filter([["categ_id.name", "=", "Pet Toys"]]).limit(5).all().then  
      n(function(result) {  
        _each(result, function(item) {  
          var $item = $(QWeb.render("PetToy", {item: item}));  
          self.$el.append($item);  
          $item.click(function() {  
            self.item_clicked(item);  
          });  
        });  
      });  
  },  
  item_clicked: function(item) {  
    this.do_action({  
      type: 'ir.actions.act_window',  
      res_model: "product.product",  
      res_id: item.id,
```

```

        views: [[false, 'form']],
        target: 'current',
        context: {},
    });
},
});

```

#上面是窗体 Action 下面看焉 client Action

```

instance.oepetstore.HomePage = instance.web.Widget.extend({
    start: function() {
        console.log("pet store home page loaded");
    },
});
instance.web.client_actions.add('petstore.homepage',
    'instance.oepetstore.HomePage');

```

@ instance.web.client\_actions 是一个 Registry 类的实例  
要打开关键字是 petstore.home 的 action ,就实例化

instance.oepetstore.HomePage

@对应的菜单

```

<record id="action_home_page" model="ir.actions.client">
    <field name="tag">petstore.homepage</field>
</record>
<menuitem id="home_page_petstore_menu" name="Home Page"
parent="petstore_menu"
    action="action_home_page"/>

```

## (20)odoo 中的 action

\* 窗口动作

```
<?xml version="1.0" encoding="utf-8" ?>
<openerp>
  <data>
    <act_window id="action_todo_stage"
      name="To-Do Task Stages"
      res_model="todo.task.stage"
      view_mode="tree,form" />

    <act_window id="todo_app.action_todo_task"
      name="To-Do Task "
      res_model="todo.task"
      view_mode="tree,form,calendar,gantt,graph"
      target="current"
      context="{ 'default_user_id':uid}"
      domain="[]"
      limit="80" />

    <act_window id="action_todo_task_stage"
      name="To-Do Task Stages"
      res_model="todo.task.stage"
      src_model="todo.task"
      multi="False" />
  </data>
</openerp>
```

可以用 ir.action.act\_window 重新其中一菜单对角

```
<record id="action_todo_stage" model="ir.actions.act_window">
  <field name="name">To-Do Task Stage</field>
  <field name="type">ir.actions.act_window</field>
  <field name="domain">["list of 3-tuples (max 250 characters)"]</field>
  <field name="context">{"context dictionary (max 250
characters)"}</field>
  <field name="res_model">todo.task.stage</field>
  <field name="view_type">form</field>
  <field name="view_mode">tree,form</field>
  <field name="search_view_id" ref="todo_task_search"/>
  <field name="view_id" ref="view_form_todo_task_ui" />
</record>
```

窗口的动作是存在 `ir.actions.act_window` 模型中的，我们可以在 xml 文件中用 `<act_window>` 来快捷定义

下面是部分属性说明，完整的可以在 `openerp/addons/base/ir/ir_actions.py` 中的 `ir.actions.act_window`

类中可以找到

# name 显示的标题

# type 动作类型，默认 `ir.actions.act_window`

# view\_id 中的 ref 值是对应视图对象的 id 触发时用哪个视图

# context 设置目标视图的上下文

# domain 过滤记录按条件，如：`[["customer", "=", true]]`

# res\_id: 当动作打开视图是表单视图时，要指定的加载记录 id, 只有 'view\_mode' 值为 form 时才有效

否则就会新建一个记录 如: `"res_id": a_product_id,`

# res\_model 动作响应的目标模型

# target 如果设置为 new 就打开新窗口，默认是 current

# view\_mode: 列出允许使用的视图模式 如 form, tree, calendar, etc 默认是 tree, form

# view\_type: 设定 tree 时的列表是树状还是普通列表， tree-树状 form-普通列表 缺省是 form

# usage: 过滤菜单和动作

# view\_ids:

# views: 是 (view\_id, view\_type) 元组对列表，第一组是动作默认打开的视图

如: `"views": [[False, "tree"], [False, "form"]]`

# limit 指列表视图时，一页的记录数，默认是 80

# auto\_refresh: 在视图中添加一个刷新功能

# groups\_id: 权限组

# search\_view\_id 指定响应的搜索视图(id, name) 元组对

# filter: 列表视图显示过滤器(bool)

# auto\_search: 加载默认视图后，自动搜索

# src\_model 指定可以启动视图的更多按钮

# multi 设为 True, 更多按钮显示在列表视图，否则显示在表单视图

系统的默认值:

```
_defaults = {
    'type': 'ir.actions.act_window',
    'view_type': 'form',
    'view_mode': 'tree,form',
    'context': '{}',
    'limit': 80,
```

```

        'target': 'current',
        'auto_refresh': 0,
        'auto_search': True,
        'multi': False,
    }

```

\* URL 动作

```

ir.actions.act_url
{
    "type": "ir.actions.act_url",
    "url": "http://odoo.com",
    "target": "self",
}

<record id="action_website_homepage" model="ir.actions.act_url">
    <field name="name">Website Homepage</field>
    <field name="url">/page/homepage</field>
    <field name="target">self</field>
</record>

# name: 显示名称
# url: 网址
# target: new 新开 self 本窗口

```

\* 服务端动作(这个是非常强大，开专题讲)

```

ir.actions.server

<record model="ir.actions.server" id="print_instance">
    <field name="name">Res Partner Server Action</field>
    <field name="model_id" ref="model_res_partner"/>
    <field name="code">
        if object.some_condition():
            action = {
                "type": "ir.actions.act_window",
                "view_mode": "form",
                "res_model": object._name,
                "res_id": object.id,
            }
    </field>
</record>

# id 服务端动作标识
# context 上下文
# model_id 链接响应的模型

```

# condition 条优  
# code python 代码设定，这里最灵活了

\* 报表动作

```
ir.actions.report.xml
  <record id="mc_crm_lead_demo_report"
model="ir.actions.report.xml">
  <field name="name">Marketing campaign demo report</field>
  <field name="type">ir.actions.report.xml</field>
  <field name="model">crm.lead</field>
  <field name="report_name">crm.lead.demo</field>
  <field
name="report_rml">marketing_campaign_crm_demo/crm_lead_mc_demo_r
eport.rml</field>
  <field name="report_type">pdf</field>
</record>
```

快捷标签<report>

#name 显示名称  
#type 动作类型，固定为 ir.actions.report.xml  
#model 响应的模型  
#report\_type 报表类型 有 ('qweb-pdf', 'PDF'),  
('qweb-html', 'HTML'),  
('controller', 'Controller'),  
('pdf', 'RML pdf (deprecated)'),  
('sxw', 'RML sxw (deprecated)'),  
('webkit', 'Webkit (deprecated)'),  
#report\_name 要用的报表模板  
#groups\_id 权限组  
#paperformat\_id  
#attachment\_use (bool)第二次打开还是前一次打开的结果  
#attachment 附件的名称  
# report\_rml rml 文件路径

\* js 调用 action

在 js 中调用 action 和直接在 python 中调用 action 是一样的  
但是有一个比较坑的区别是 views: [[false, 'list'],[false, 'form']],  
这里与 form 对应的时 list 而不是 tree 然而在 python 里边调用 action 时 tree ,  
这个点是很难发现的。 是通过源码查找找到的。

```

instance.web_calendar.CalendarView.include({
  open_event: function(id, title) {
    var self = this;
    console.log(self,"id:",id,"title:",title,'model:',self.model);
    if (self.model=='crm.phonecall'){
      this.do_action({
        type: 'ir.actions.act_window',
        res_model: "crm.phonecall",
        view_mode: 'tree',
        view_type: 'tree,form',
        views: [[false, 'list'],[false, 'form']],
        domain:'[("previous_contact_id","=",'+id+)]',
        target: 'current',
        context:"{'default_previous_contact_id':"+id+"}",
      }, {
        on_reverse_breadcrumb: function () {
          self.reload();
        }
      });
    }else{
      this._super.apply(this, arguments);
    }
  }
});

```

\* py 文件调用 action

知识点 1. "['id','in',[' + ',''.join(map(str, sale\_order\_ids)) + "]]"

在实际下情况下运用py的语法。这操作就是 把 sale\_order\_ids 的id列表 转换成 id 字符串

就是 odoo 的 domain 的表达式是字符串

#这个是一个简单的一个方法

```

model_data_obj = self.pool.get('ir.model.data')
stock_picking_tree_ids = model_data_obj.xmlid_to_res_id(
    cr, SUPERUSER_ID, 'dftg_stock_picking_tree')
view_picking_form_id = model_data_obj.xmlid_to_res_id(
    cr, SUPERUSER_ID, 'stock.view_picking_form')
return {
  'type': 'ir.actions.act_window',
  'res_model': 'stock.picking',
  'view_mode': 'tree,form',
  'view_type': 'form',

```

```

        'name': u'查看出/入库单',
        'views': [(stock_picking_tree_ids, 'tree'), (view_picking_form_id,
'form')],
        'view_id': stock_picking_tree_ids,
        'domain': "[('so_id','=', " + str(ids[0]) + "),(('state','not in',['waiting']))]",
    }

```

# 这种方法是更常用更强大的 会动态的返回 form 或者 tree 很方便  
适用各种需求

```

mod_obj = self.pool.get('ir.model.data')
act_obj = self.pool.get('ir.actions.act_window')
result = mod_obj.get_object_reference(
    cr, uid, 'dftg_ext', 'fake_sale_order_action')
id = result and result[1] or False
result = act_obj.read(cr, uid, [id], context=context)[0]
# compute the number of invoices to display

if len(sale_order_ids) > 1:
    result[
        'domain'] = "[('id','in',[' + ','.join(map(str, sale_order_ids)) + '])]"
else:
    res = mod_obj.get_object_reference(
        cr, uid, 'dftg_ext', 'fake_sale_order_form')
    result['views'] = [(res and res[1] or False, 'form')]
    result['res_id'] = sale_order_ids and sale_order_ids[0] or False
return result

```

\* 客户端动作

openerp/addons/base/ir/ir\_actions.py

ir.actions.client

```

<record id="action_client_sale_menu" model="ir.actions.client">
    <field name="name">Open Sale Menu</field>
    <field name="tag">reload</field>
    <field name="params" eval="{ 'menu_id':
ref('base.menu_base_partner') }"/>
</record>

```

#name 显示名称

#tag

#res\_model 目标模型

#context 设置目标视图的上下文

#params 带上参数

#params\_store

## (21)odoo 中的 QWeb 模板引擎

### \* 概述

QWeb 是 odoo 主要模板引擎，采用 xml 表述，最后生成 HTML 文件

### \* 一般用法

# 条件表达式

```
<t t-if="record.effort_estimate.raw_value > 0">
  <li>Estimate <field name="effort_estimate"/></li>
</t>
```

比较符号:

lt(<)   lte(<=)   gt(>)   gte(>=)

注 <= 不能用在表达式中，只能用字母代替

# 输出值 t-esc 和 t-row

```
<t t-esc="record.message_follower_ids.raw_value" />
<t t-row="record.message_follower_ids.raw_value" />
```

t-esc 过滤安全值，像 html 元素

t-row 数据库中的原始数据

# 循环

```
<t t-foreach="record.message_follower_ids.raw_value" t-as="rec">
  <t t-esc="rec" />;
</t>
```

t-foreach="record.message\_follower\_ids.raw\_value.slice(0, 3)" 还可以切片

片

还有一些变量

rec\_index 从 0 开始循环索引

rec\_size 要循环的记录集大小

rec\_first 第一个元素

rec\_last 最后一个元素

rec\_even index 为偶数时为真

rec\_odd index 为奇数时为真

rec\_parity 是偶数和奇数

rec\_all 表示循环结束的标识

rec\_value 循环一个字典时，的键的值

# 动态属性

```
<div>
```

```

    <t t-foreach="record.message_follower_ids.raw_value.slice(0, 3)"
    t-as="rec">
      
    </t>
  </div>
  t-att- prefixed 如 <img>的 src 就可以 t-att-src="..."

```

# 属性的字符替换

```

<span t-attf-class="oe_kanban_text{{
  record.date_deadline.raw_value and
  !(record.date_deadline.raw_value > (new Date()))
  ? '_red' : '_black' }}">
  <field name="date_deadline"/>
</span>
t-attf-prefixed 取代内容，上面的就是动态类

```

# 变量设置

```

#设置变量 t-set t-value
<t t-set="new_variable" t-value="True" />
设置了变量 new_variable 的值 为 True
t-value 也可以是表达式
<t t-set="foo" t-value="2+1">
设置了变量 foo 值为 3
t-value 可以是一段 html
<t t-set="foo">
  <li>ok</li>
</t>
设置了变量 foo 为 <li>ok</li>

```

# 设置属性

```

t-att-$name
$name 是属性名
<div t-att-a="66" />
结果:
<div a="66"></div>

```

t-attf-\$name 用于混合,有字符串也有变量, 变量用{{}}

```

<t t-foreach="[1, 2, 3]" t-as="item">
  <li t-attf-class="row {{ item_parity }}"><t t-esc="item"/></li>

```

</t>

t-att=mapping 键值对组成属性，主要用多对

```
<div t-att="{ 'a':1,'b':2}" />
```

结果：

```
<div a="1" b="2"></div>
```

t-att=pair 一对，这个对一个键，后一个是值

```
<div t-att="['a','b']" />  <=>  <div t-att="('a','b')" />
```

结果：

```
<div a="b"></div>
```

# 包含其它模板

```
<t t-name="follower_avatars">
  <div>
    <t t-foreach="record.message_follower_ids.raw_value.slice(0, 3)"
      t-as="rec">
      
    </t>
  </div>
</t>
. . .
<t t-call='follower_avatars' />
```

t-call 调用其它模板

复用灵活一些

```
<t t-name="follower_avatars">
  <div>
    <t t-foreach="record.message_follower_ids.raw_value.slice(0,
arg_max)"
      t-as="rec">
      
    </t>
  </div>
</t>
. . .
```

```

<t t-call='follower_avatars'>
  <t t-set="arg_max" t-value='3' />

  <t/>

```

# QWeb 其它指令

```

<p t-att="{ 'class': 'oe_bold', 'name': 'test1' }" />

```

结果显示

```

<p class="oe_bold" name="test1" />

```

t-att 接受字典

```

<p t-att="['class','oe_bold']"

```

结果显示

```

<p class="oe_bold">

```

# card 类式加菜单

```

<div class="oe_dropdown_kanban oe_dropdown_toggle">
  <span class="oe_e">í</span>
  <ul class="oe_dropdown_menu">
    <t t-if="widget.view.is_action_enabled('edit')">
      <li>
        <a type="edit">Edit...</a>
      </li>
    </t>
    <t t-if="widget.view.is_action_enabled('delete')">
      <li>
        <a type="delete">Delete</a>
      </li>
    </t>
    <!-- Color picker option: -->
    <li>
      <ul class="oe_kanban_colorpicker"
        data-field="color"/>
    </li>
  </ul>
</div>

```

# card 类式加颜色

```

<field name="color" />
<div class="oe_kanban_card">
  <div t-attf-class="oe_kanban_card
    #{kanban_color(record.color.raw_value)}">

```

# 为长文本加省略号

```
<t t-esc="kanban_text_ellipsis(record.name.value, 32)" />  
过超 32 个字符就加... 不显示内容了
```

# 自定义 css 和 javascript 的资源

```
<?xml version="1.0" encoding="utf-8"?>  
<openerp>  
  <data>  
    <template id="assets_backend"  
      inherit_id="web.assets_backend"  
      name="Todo Kanban Assets">  
      <xpath expr="." position="inside">  
        <link rel="stylesheet"  
          href="/todo_kanban/static/src/css/todo_kanban.css"  
        />  
        <script type="text/javascript"  
          src="/todo_kanban/static/src/js/todo_kanban.js">  
        </script>  
      </xpath>  
    </template>  
  </data>  
</openerp>
```

# 调用其它模板

采用 t-call

```
<template id="sub">  
  <t t-esc="identifier" />  
</template>  
<template id="hello">  
  <p>  
    hello,  
    <t t-call="module.sub">  
      <t t-set="identifier" t-value="name" />  
    </t>  
  </p>  
</template>
```

# 字段渲染

```
@http.route('hello/<model("res.users"):user') # 给用户的 id 即可
def hello(self,user,**kw)
    return http.request.render('module.hello',{'user':user})
```

```
-----
<template id="hello">
    <p t-field="user.display_name" />
</template>
```

# 可用字段选择修饰

```
<template id="hello">
    <p t-field="user.creat_date" />
    <p
t-field="user.creat_date" t-field-options='{ "format": "long" }'/>
    <p t-field="user.creat_date" t-field-options='{ "format": "EEE" }'/>
</template>
```

```
-----
<template id="hello">
    <p t-field="user.wealth" />
    <p t-field="user.wealth" t-field-options='{
        "widget": "monetary"
        "display_currency": "user.company_id.currency_id"
    }'/>
</template>
```

```
-----
<template id="hello">
    <p t-field="user.create_date"
t-field-options='{ "widget": "relative" }' />
</template>
```

# 模板继承

```
<template id="hello">
    <p> Base template </p>
</template>
<template id="hello2" inherit_id="hello" name="Extender">
    <xpath expr="//p" position="before">
        <h1>Extended!</h1>
    </xpath>
</template>
```

得到的结果:

```
<h1>Extended!</h1>
```

```

    <p>Base template</p>
    -----
    <template id="hello">
        <p class="a">A</p>
        <p class="b">B</p>
    </template>
    <template id="hello2" inherit_id="hello" name="Extender">
        <xpath expr="//p[class('b')]" position="before">
            <h1>Extended!</h1>
        </xpath>
    </template>
    得到的结果:
    <p class="a">A</p>
    <h1>Extended!</h1>
    <p class="b">B</p>
    -----
    调用系统的基础模板:
    <template id="hello">
        <t t-call="website.layout">
            <p class="a">A</p>
            <p class="b">B</p>
        </t>
    </template>
    <template id="hello2" inherit_id="hello" name="Extender">
        <xpath expr="//p[class('b')]" position="before">
            <h1>Extended!</h1>
        </xpath>
    </template>
    # 调试
    t-debug
    <t t-debug="pdb" />
    <=>
    importlib.import_module("pdb").set_trace()

    #python 的请求模板
    response = http.request.render('my-template',{'context_value':99})
    用得是 http.request.render()方法

    *代码分析
    #扫描枪的操作界面
    <openerp>

```

```

<data>
  <template id="assets_backend" name="stock assets"
inherit_id="web.assets_backend">
    <xpath expr="." position="inside">
      <link rel="stylesheet" href="/stock/static/src/css/stock.css"/>
      <script type="text/javascript"
src="/stock/static/src/js/widgets.js"> </script>
    </xpath>
  </template>
  ....
</data>
<openerp>

```

## (22)odoo 安装旧模块报错处理

一些老版本的模块没有得到升级，所以经常碰到模块无法安装的问题。

No module name osv

将模块的 `from osv import osv,fields` 改为 `from openerp.osv import osv,fields`

其实这是一个编程规范问题，旧版模块代码里很多这种导入方式，一个一个改对于不懂代码的或者 openerp 新手是不现实的。

众所周知，openerp 的运行入口是 `openerp-server.py`，在 6.0 及之前版本，这个入口文件和其他 `server` 包是在同一个目录的，

但是 openerp6.1 开始这个目录被提升了一个目录。`server` 包都放在了一个叫做 `openerp` 的目录下，

而 `openerp-server.py` 被重命名为 `openerp-server`（没有后缀名）和 `openerp` 目录同级。

而 `python` 的特性决定它在导入包的时候是按入口文件的位置找相对路径的。

所以这个顶级目录结构改动的结果就是，我们需要在所有的 `import` 语句里加上 `openerp.` 这个前缀。

必须有个临时解决方案，那就是 `openerp/conf/deprecation.py` 这个文件

里面定义了一个变量，`open_openerp_namespace`，在 7.0 里这个值是 `True`，也就是说即使你模块里 `import osv` 也不会报错，

因为 `server` 乖乖滴去 `openerp` 这个目录去找 `osv` 目录，而不会报错。

但是 8.0 不一样了，openerp 公司已经改过了所有他们负责的模块，他们不再需要这个临时方案了，

然后我们看到在 8.0 版本里这个变量值为设为了 `False`

这就是 7.0 里可以安装的 `oecn_base_fonts`、`auto_backup` 等模块在 8.0 里无法安装的原因。

如果你希望使用其他非官方模块，我建议你把这个值改成 `True`

## (23)odoo 中的 domain 表达式

\* Domain 表达式

```
# 用于过滤记录数，相当于 sql 的 where
('field', 'operator',value) 每个条件表达式是元组类型
    第一个是对象的一个 column,也就是字段名
    第二个是比较运算符
    第三个就是用来比较的值
domain=[('user_id', '=', uid)] 当前用户做为条件过滤
#比较运算符如下:
    <,>,<=,>=,!=
    =?
    =like
    like
    not like
    ilike(大小写不敏感)
    not ilike
    =ilike
    child_of 找直接和间接的子对象
    in
    not in
#条件可以用逻辑符连起来 用列表类型来组织
    逻辑运算符作为前缀放置于条件前面
    | & 必须两个条件链接 ! 作用于一个条件 理解时，从里往外剥

& 是且的意思，是默认
| 是或
! 是非，相反的意思
['!','user_id','=',uid)] 不是当前用户的记录
['|','user_id','=',uid),('user_id','=',False)] 不是当前用户，或没有用户的记录
复杂一点的:
['|', ('message_follower_ids', 'in', [user.partner_id.id]),'|', ('user_id', '=',
user.id),
    ('user_id', '=', False)]
逻辑是连后面两个 domain 条件

再来一个
['|','|',('group_ids','in',[g.id for g in
user.groups_id]),('user_id','=',user.id),
    '&',('user_id','=',False),('group_ids','=',False),'|','|',('company_id','=',F
alse),
    ('company_id','child_of',[user.company_id.id]),('company_id.child_ids',
'child_of',[user.company_id.id])]
```

分解理解:

```
[|,
'|',('group_ids','in',[g.id for g in user.groups_id]),('user_id','=',user.id),
'&','(user_id','=',False),('group_ids','=',False),
'|',
'|',('company_id','=',False),('company_id','child_of',[user.company_id.id]
),
('company_id.child_ids','child_of',[user.company_id.id]))]
```

```
domain="[('create_date','=',(context_today() +
datetime.timedelta(days=-1)).strftime('%Y-%m-%d'))]"
domain="[('date','<=',time.strftime('%d/%m/%Y'),
('date','>=',((context_today()-relativedelta(months=3)).strf
me('%d/%m/%Y')))]"
过去三个月
```

# 在 Action 中定义, domain 用于对象默认搜索条件

```
<field name="domain">[('state','not in',('draft','sent','cancel'))]</field>
打开订单窗口, 不搜索处于('draft','sent','cancel') 三种状态的订单
```

# 在对象(或视图)的关联字段 字段值 domain 用于过滤

```
'product_id':fields.many2one('product.product','Product',domain=[('sale
_ok','=',True)],chang_default=True)
定义关联产品, 只显示可销售产品
```

# 在搜索视图 domain 用于自定义过滤条件

```
<field name="name" string="Sale Order" filter_domain="[|('name',
'ilike',self),('client_order_ref','ilike',self)]"
在搜索视图输入订单编号, 同时按订单编号和客户关联编号搜索
<filter string="My Sales Orders" domain="[('user_id','=',uid)]" help="My
Sales Orders" icon="terp-personal"
name="my_sale_orders_filter" />
```

# 在记录规则中定义 domain 用于定义用户对对象记录的访问权限

```
<field
name="domain_force">[|,('company_id','=',False),('company_id','child_of',[
user.company_id.id])]
定义用户允许查询未指定分公司或订单指定分公司用户具有的访问权限的销售订单
[|,('section_id','=',user.default_section_id),('section_id','=',False)]
查看自己的团队
```

\* 实例:

# 过滤当天的订单

```
[('date_order','<=', datetime.datetime.combine(
context_today(),datetime.time(23,59,59))),
('date_order','>=', datetime.datetime.combine(context_today(),
datetime.time(0,0,0)))]
```

## (24)odoo 中模型标识汇总

\* 设置->技术->数据结构->模型

模型	模型描述	类型	瞬态模型
account.account	科目	基础对象	假
account.account.template	科目模板	基础对象	假
account.account.type	类型	基础对象	假
account.addtmpl.wizard	account.addtmpl.wizard	基础对象	真
account.aged.trial.balance	科目的账龄分析报告	基础对象	真
account.analytic.account	辅助核算项	基础对象	假
account_analytic_analysis.summary.month	月的小时数合计	基础对象	假
account_analytic_analysis.summary.user	按用户汇总时间	基础对象	假
account.analytic.balance	辅助核算余额	基础对象	真
account.analytic.chart	辅助核算项一览表	基础对象	真
account.analytic.cost.ledger	成本科目明细分析	基础对象	真
account.analytic.cost.ledger.journal.report	分析本期成本明细账的报表	基础对象	真
account.analytic.default	辅助核算分摊	基础对象	假

## (26)odoo 中的序列运用

\* 模块中增加序列

\_\_\_openerp\_\_\_ .py :

```
...
'data': [
    'product_data.xml',
],
...
-----
```

product\_data.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<openerp>
  <data noupdate="1">

    <record id="sequence_type" model="ir.sequence.type">
      <field name="name">Sequence</field>
      <field name="code">product.internal.code</field>
    </record>

    <record id="sequence" model="ir.sequence">
      <field name="name">product</field>
      <field name="code">product.internal.code</field>
      <field name="padding">4</field>
    </record>

  </data>
</openerp>
```

# model="ir.sequence.type" 序列类型 设置->技术->序列与标识符->序列编码

找到

# name 类型名称

# code 类型编码 唯一不重名

# model="ir.sequence" 序列 设置->技术->序列与标识符->序列 找到

# name 序列名称

# code 序列用到的编码

# padding 多少位数字

-----

product.py :

@api.model

```

def create(self, vals):
    if (
        not vals.get('internal_code', False) and
        not self._context.get('default_internal_code', False)):
        vals['internal_code'] = self.env[
            'ir.sequence'].get('product.internal.code') or '/'
    return super(product, self).create(vals)

# 上面做了这么多就是为
self.env['ir.sequence'].get('product.internal.code')
这句做基础

_sql_constraints = {
    ('internal_code_uniq', 'unique(internal_code)',
     'Internal Code mast be unique!')
}

```

## (27)odoo 中改变菜单动作的默认视图

一个动作下面有多个视图来支持，像表单视图、列表视图、看板视图、图表视图等

这时我们想改变系统默认指定的视图，方法其实有两种，一种是通过面板改，一种是开发一个小模块

举一例：项目默认打开是用了看板视图，这里要改成列表视图

系统默认的如下：

clip\_image002[1]

第一种方法：通过面板改,这里也分两种方法（A,B）

A 方法：

激活开发者模式

clip\_image004[1]

找到项目的“编辑动作”

clip\_image006[1]

clip\_image008[1]

改动红框其中一个

（1） 视图模式 从 kanban,tree,form,gantt 改为 tree,kanban,form,gantt

（2） 视图参照 从 project.project.kanban 改为 project.project.tree

上面 2 个只要改一个就可以，改好保存即可

B 方法：

首先我们要开启 admin 的技术特性

clip\_image010[1]

接着找到项目对应的动作

clip\_image012[1]

clip\_image014[1]

clip\_image016[1]

点完“项目”，下面就出现对应的动作，接着把这个弹出框关了

clip\_image018

改一下对应的红框为如下所示：

clip\_image020

或调整“视图模式”的值：

把 kanban,tree,form,gantt 换一下顺序为 tree,kanban,form,gantt

保存完，再打开项目菜单如下：

clip\_image022

个人面板操作建议采用 A 方法相对简单

第二种是代码改：

Addons/project/project\_view.xml

找到

```
<record id="open_view_project_all" model="ir.actions.act_window">
<field name="name">Projects</field>
<field name="res_model">project.project</field>
<field name="view_type">form</field>
<field name="domain">[]</field>
<field name="view_mode">kanban,tree,form,gantt</field>
<field name="view_id" ref="view_project_kanban"/>
```

….. 改

```
<field name="view_id" ref="view_project_kanban"/>为
```

```
<field name="view_id" ref="view_project"/>
```

## (28)odoo 中 css 可用颜色对照表

<http://www.cnblogs.com/toby2chen/p/5252945.html>

## (29)odoo 的可用小图标

\* 系统的小图标都采用了 fontawesome

官网是 <http://fontawesome.dashgame.com/>

\* 运用小图标

# 首先打开官网 <http://fontawesome.dashgame.com/>

找到喜欢的小图标，举例 看到一个漏斗图标，在旁边看到

英文名 filter

# 写到视图文件的元素中，用 icon

如：

```
<button string="Products"
      class="oe_stat_button"
      icon="fa-filter" name="% (act_product_location_open)d" type="action"
      context="{ 'location_id': active_id }"
/>
```

有英文名前加 fa ,最终是 icon="fa-filter"

\* 加强用法

# 默认我们加的是标准小图标，若要其它大的，或特效参看

官网 <http://fontawesome.dashgame.com/>

写得特别的详细

## (30)odoo 中的快捷标签

### \* 快捷标签

提供快捷标签是为了简化代码的编码，把复杂的工作封装化

### \* 找到封装化的源码：

```
openerp/tools/convert.py    xml_import
    self._tags = {
        'record': self._tag_record,
        'delete': self._tag_delete,
        'function': self._tag_function,
        'menuitem': self._tag_menuitem,
        'template': self._tag_template,
        'workflow': self._tag_workflow,
        'report': self._tag_report,

        'ir_set': self._tag_ir_set,
        'act_window': self._tag_act_window,
        'url': self._tag_url,
        'assert': self._tag_assert,
    }
```

可以看到系统常用到的快捷标签

```
# record 对应模型 ir.model.data
# delete 删除指定模型满足一定条件的记录
# function 执行指定模型中方法
# menuitem 对应模型 ir.ui.menu 定义菜单
# template 对应模型 ir.ui.view 定义视图
# workflow 触发工作流
# report 对应模型 ir.actions.report.xml
# ir_set
# act_window 对应模型 ir.actions.act_window
# url 对应模型 ir.actions.act_url
# assert
```

使用权限是 标签用 groups ,模型确用 groups\_id

### \* record 标签是定义数据最基础的一个

```
<record ...>
    <field>....</field>
    .....
</record>
```

\* delete

```
<?xml version="1.0" encoding="utf-8"?>
<openerp>
  <data noupdate="1">
    <delete model="ir.rule" search="[('id', '=',
      ref('todo_app.todo_task_user_rule'))]" />

    <record id="todo_task_per_user_rule" model="ir.rule">
      <field name="name">ToDo Tasks only for owner</field>
      <field name="model_id" ref="model_todo_task"/>
      <field name="groups"
        eval="[(4, ref('base.group_user'))]" />
      <field name="domain_force">
        ['!('user_id','in', [user.id,False]),
        ('message_follower_ids','in',[user.partner_id.id])]
      </field>
    </record>
  </data>
</openerp>
```

常用于规则覆盖重定义

# model 指定要删除记录的模型

# id 外标识 id

# search domain 的表达式，定义哪些记录要删除

\* function

```
<function
  model="res.partner"
  name="create_membership_invoice"
  eval="(ref('base.res_partner_2'),
  ref('membership_0'),
  {'amount':180})"
/>
```

常用于设置示例数据

#model:指定要用到的模型

#name:指定模型中的方法名

#eval: 给指定的方法把参数传过去

\* menuitem

```
<menuitem id="menu_todo_task_stage"
  name="To-Do Stages"
  parent="menu_todo_task_main"
  sequence="20"
  groups=""
  action="action_todo_stage" />
```

# id 菜单的唯一 id 用于父子级别和调用  
 # name 在视图中显示的名字 如果定义的 action,这个可以省略, 会用对应 action 的 name 值  
 # sequence 显示排序  
 # parent 本菜单的父菜单, 子菜单都要指定, 只有顶级菜单不要指定  
 # action 本菜单的连接动作  
 # groups 指定权限组, 用户组的 extraID

```
<record id="todo_app.menu_todo_task" model="ir.ui.menu">
  <field name="name">To-Do Stages</field>
  <field name="parent">menu_todo_task_main</field>
  <field name="sequence">20</field>
  <field name="action">action_todo_stage</field>
  <field name="groups_id" ref="" />
</record>
```

\* template

```
<template id="assets_backend"
  inherit_id="web.assets_backend"
  name="Todo Kanban Assets" >
  <xpath expr="." position="inside">
    <link rel="stylesheet"
      href="/todo_kanban/static/src/css/todo_kanban.css"
    />
    <script type="text/javascript"
      src="/todo_kanban/static/src/js/todo_kanban.js">
    </script>
  </xpath>
</template>
```

```
<record id="assets_backend" model="ir.ui.view">
  <field name="name">Todo Kanban Assets</field>
  <field name="inherit_id">web.assets_backend</field>
  <field name="arch" type="xml">
    <xpath expr="." position="inside">
      <link rel="stylesheet"
        href="/todo_kanban/static/src/css/todo_kanban.css"
      />
      <script type="text/javascript"
        src="/todo_kanban/static/src/js/todo_kanban.js">
      </script>
    </xpath>
  </field>
</record>
```

```

    </xpath>
  </field>
</record>

```

template 重点指明是 Qweb 引擎

#### \* workflow

```

<workflow model="sale.order"
  ref="sale_order_4"
  action="order_confirm" />

```

对应订单改变状态  
这个类似可以<button>

```

<button name="order_confirm" type="workflow" states="draft"
  string=" 确认 " class="oe_highlight" />

```

#### \* report

```

<report
  id="account_invoices"
  model="account.invoice"
  string="Invoices"
  report_type="qweb-pdf"
  name="account.report_invoice"
  file="account.report_invoice"
  attachment_use="True"
  attachment="(object.state in ('open','paid')) and
  ('INV'+(object.number or '').replace('/','')+'.pdf')"
/>

```

#name 显示名称

#model 响应的模型

#report\_type 报表类型 有 ('qweb-pdf', 'PDF'),  
('qweb-html', 'HTML'),  
('controller', 'Controller'),  
('pdf', 'RML pdf (deprecated)'),  
('sxw', 'RML sxw (deprecated)'),  
('webkit', 'Webkit (deprecated)'),

#report\_name 要用的报表模板

#groups 权限组

#attachment\_use (bool)第二次打开还是前一次打开的结果

#attachment 附件的名称

```

<record id="account_invoices"

```

```

model="ir.actions.report.xml">
<field name="name">account.report_invoice</field>
<field name="model">todo.task</field>
<field name="report_type">qweb-pdf</field>
<field name="attachment_use">true</field>
<field name="attachment">(object.state in ('open','paid')) and
('INV'+(object.number or "").replace('/','')+'.pdf</field>
</record>

```

\* ir\_set

\* act\_window

```

<act_window id="action_todo_stage"
name="To-Do Task Stages"
res_model="todo.task.stage"
view_mode="tree,form" />

```

# name 显示的标题

# view\_id 中的 ref 值是对应视图对象的 id 触发时用哪个视图

# context 设置目标视图的上下文

# domain 过滤记录按条件，如：[["customer", "=", true]]

# res\_id: 当动作打开视图是表单视图时，要指定的加载记录 id,只有 ‘view\_mode’ 值为 form 时才有效

否则就会新建一个记录 如: "res\_id": a\_product\_id,

# res\_model 动作响应的目标模型

# target 如果设置为 new 就打开新窗口，默认是 current

# view\_mode:列出允许使用的视图模式 如 form, tree, calendar,etc 默认是 tree,form

# view\_type:设定 tree 时的列表是树状还是普通列表， tree-树状 form-普通列表 缺省是 form

# usage: 过滤菜单和动作

# view\_ids:

# views:是(view\_id,view\_type) 元组对列表，第一组是动作默认打开的视图

如: "views": [[False, "tree"], [False, "form"]]

# limit 指列表视图时，一页的记录数，默认是 80

# auto\_refresh: 在视图中添加一个刷新功能

# groups:权限组

# search\_view\_id 指定响应的搜索视图(id,name) 元组对

# filter:列表视图显示过滤器(bool)

# auto\_search: 加载默认视图后，自动搜索

# src\_model 指定可以启动视图的更多按钮

# multi 设为 True, 更多按钮显示在列表视图，否则显示在表单视图

```

<record model="ir.actions.act_window" id="action_todo_stage">

```

```
<field name="name">To-Do Task Stages</field>
<field name="res_model">todo.task.stage</field>
<field name="view_mode">tree,form</field>
</record>
```

\* url

```
<url
  "string": "Back Home",
  "url": "http://",
  "target": "self" />
```

# string: 显示名称

# url: 网址

# target: new 新开 self 本窗口

```
<record model="ir.actions.act_url" id="test_home">
  <field name="name">Back Home</field>
  <field name="type">ir.actions.act_url</field>
  <field name="url">http://</field>
  <field name="target">self</field>
</record>
```

\* assert

## (31)odoo 中的时间

\* 在 model 中

```
from datetime import datetime, timedelta
import time

from openerp.tools import DEFAULT_SERVER_DATE_FORMAT,
DEFAULT_SERVER_DATETIME_FORMAT
```

上面要引入的包

```
DEFAULT_SERVER_DATE_FORMAT = "%Y-%m-%d"
DEFAULT_SERVER_TIME_FORMAT = "%H:%M:%S"
DEFAULT_SERVER_DATETIME_FORMAT = "%s %s" % (
    DEFAULT_SERVER_DATE_FORMAT,
    DEFAULT_SERVER_TIME_FORMAT)
```

-----

#没有设定日期，就引入系统当天的日期

```
if not date_order:
    date_order = time.strftime(DEFAULT_SERVER_DATE_FORMAT)
```

\* 在视图中

## (32)odoo 中的编码问题

对于全部是英文就不存在问题，但我们常用中文，这样会导致一个棘手的问题

约定：

系统 Ubuntu trusty14.04 自带 python2.7.6

python2.7.9 自己升级了

升级方法：

-----

准备

```
# apt-get -y install build-essential libreadline-gplv2-dev libncursesw5-dev libssl-dev libsqlite3-dev  
tk-dev libgdbm-dev libc6-dev libbz2-dev
```

安装 python2.7.9

```
# mkdir -p /opt/soft/python
```

```
# cd /opt/soft/python
```

```
# wget https://www.python.org/ftp/python/2.7.9/Python-2.7.9.tgz
```

```
# tar -xzf Python-2.7.9.tgz
```

```
# cd Python-2.7.9
```

```
# ./configure
```

```
# make
```

```
# make install
```

升级 python 完成

-----

Python 默认编码为 ascii

clip\_image001

把它设为 utf-8, 这个编码处理相对好一些

在 python 的 Lib\site-packages 文件夹下新建一个 sitecustomize.py, 内容为:

Python 代码

```
# encoding=utf8
```

```
import sys
```

```
reload(sys)
```

```
sys.setdefaultencoding('utf8')
```

如下图:

clip\_image003

具体的 lib/site-packages 每个人有所有不同, 找到自己的就可以。

改好重启 python 服务, 说白了就是 ctrl+D 退出控制台, 再输入 python 进入

-----

核对改的效果:

clip\_image004

好了核对正确。

-----

下面以升级一个模块, 模块中有中文文件名为例:

模块目录如下:

clip\_image005

点“模块升级”报错了

clip\_image007

查到 openerp/tools/osutil.py", line 57, in walksymlinks

没有编码为 utf-8,自然无法正确得到中文的文件名,这时的变量是 unicode

只能加一行,如下:

clip\_image008

保存就可以,有这一行,以后模块中有文件名为中文的升级时就不报错了

刚才报错了刷新显示如下:

clip\_image010

这时不要急,用数据库工具连到数据库 找到 ir\_module\_module 这个表,接着找到刚才模块升级的模块 rain\_china\_region

clip\_image011

在数据表中筛选一下

clip\_image013

把 红框中的 to upgrade 改为 installed

每当模块升级时,一定记得模块的目录名,这样升级万一错了,改一下状态就可以重新来做。

要不然,系统崩溃了不知如何处理。

clip\_image015

点一下钩完成

上面改动了 python 代码,一定要记得重启 odoo 服务 生效

接着去刷新浏览器

clip\_image017

复活了,再点“模块升级”,ok 可以正常升级

对于文件的中文 一般不会乱码,主要是 python 设定了默认编码为 utf-8

文件编码是 utf-8,内容编码也是 utf-8 这样就一致了

### (33)odoo 中产品价格字段

打开 `product.template` 和 `product.product` 模型发现有很多关于价格描述的字段

`product.template:`

- `price`
- `list_price`
- `lst_price`
- `standard_price`

`product.product:`

- `price`
- `price_extra`
- `lst_price`

`price:`

这个在 `product.template` 中是计算字段 用到产品价格表、销售计量单位、币种 计算得出的价格，计算基础是 `list_price`  
在 `product.product` 也是同等含义 计算基础是 `list_price price_extra`

`list_price`

这个只在 `product.template` 中，是产品销售的基准价格，但不一定最终销售价格，最终销售价格是上面的 `price`，这里 `list_price` 可以用来显示到网站，这是基准价，建议定义好了不要随便改，否则会影响没有完成会计相关的票据

`lst_price`

在 `product.template` 中 和 `list_price` 是等价的  
在 `product.product` 中，则是 `list_price` 加上了 `price_extra` 价格  
`lst_price` 改变了，会减去 `price_extra` 价格，然后改变 `list_price` 价格

`standard_price`

只在 `product.template` 中，它是产品采购时的成本价，但要记住只在成本计算方法为标准计价法才时，若是实时计价法，这个就不是成本价，那成本价放到每个 `quant` 中了。
